TOE	Time of Ephemerides
TOW	Time of Week
URA	User Range Accuracy
URAI	User Range Accuracy Index
USNO	United States Naval Observatory
UTC	Universal Time Coordinated

1 RINEX 3.05 TO 4.00 MAJOR CHANGES

The list below contains **the major changes** between the current and the previous RINEX format versions. A major version number has been assigned to all RINEX files since the Navigation files are no longer backwards compatible. The full list of changes is in section 9.

In the Navigation files;

- In Table A7 removed the optionality of the **LEAP SECONDS** line in the header of the Navigation files, the line now becomes compulsory.
- In Table A7 removed the **IONOSPHERIC CORR** line from the Navigation file header.
- In Table A7 removed the **TIME SYSTEM CORR** line from the Navigation file header
- For all navigation messages added navigation message record new first line.
- Added GPS **CNAV** Navigation Message Table A10 to define the GPS CNAV message.
- Added GPS **CNV2** Navigation Message Table A11 to define the GPS CNAV-2 message.
- Added BDS **CNV1** Navigation Message Table A22 to define the BDS-3 B1C message.
- Added BDS **CNV2** Navigation Message Table A23 to define the BDS-3 B2a message.
- Added BDS **CNV3** Navigation Message Table A24 to define the BDS-3 B2b message.
- Added QZSS **CNAV** Navigation Message Table A18 to define the QZSS CNAV message.
- Added QZSS **CNV2** Navigation Message Table A19 to define the QZSS CNAV-2 mssg.
- Added Table A30, Table A31, Table A32, Table A33, and Table A34 to the Appendix to define the new **STO**, **EOP**, and **ION** message record descriptions.
- Added section 5.4.9 to describe the new **STO** Time offset correction messages in the navigation message file.
- Added section 5.4.10 to describe the new **EOP** Earth orientation parameter messages in the navigation message file.
- Added section 5.4.11 to describe the new **ION** Earth orientation parameter messages in the navigation message file.
- Added **REC # / TYPE / VERS** optional line to the Navigation message file header in Table A7 (expected in station navigation files).

In the Observation files;

- In Table A2 made the header line **SYS / PHASE SHIFT** optional.
- Removed the mandatory condition on the GLONASS Code-Phase alignment header record **GLONASS COD/PHS/BIS** in section 5.2.16 and Table A2.
- Added definition of QZSS L1 C/B new signal to Table 14 with observation codes **C1E**, **L1E**, **D1E**, **S1E** and in Table A39 as the new reference signal when L1 C/A is not available.
- Updated QZSS PRN code assignments to include L1 C/B PRNs in Table 6.

In all files;

- Added three free text optional header lines to Table A2, Table A7, and Table A36 to support the FAIR data principles addressing the Finding, Accessing, Interoperability and Reusability of public data;
 - **DOI** – Digital Object Identifier
 - **LICENSE OF USE** – Data license
 - **STATION INFORMATION** – Link to station metadata

2 THE PHILOSOPHY AND HISTORY OF RINEX

The first proposal for the *Receiver Independent Exchange Format; RINEX* was developed by the Astronomical Institute of the University of Bern for the easy exchange of the Global Positioning System (GPS) data to be collected during the first large European GPS campaign EUREF 89, which involved more than 60 GPS receivers of 4 different manufacturers. The governing aspect during the development was the following fact:

Most geodetic processing software for GNSS data use a well-defined set of observables:

- The **carrier-phase measurement** at one or both carriers, being a measurement on the beat frequency between the received carrier of the satellite signal and a receiver-generated reference frequency.
- The **pseudorange (code) measurement**, equivalent to the difference of the time of reception (expressed in the time frame of the receiver) and the time of transmission (expressed in the time frame of the satellite) of a distinct satellite signal.
- The **doppler measurement**, the difference between the observed and emitted frequency of the carrier.
- The **signal-to-noise ratio (SNR) measurement**, the carrier to noise density ratio (C/N0) or the ratio of the received signal power to the noise power.
- The **observation time**, the reading of the receiver clock at the instant of validity of the measurements.

Usually, geodetic processing software assumes that the observation time in RINEX is valid for **all** measurements, **and** for all satellites observed.

Consequently, all these programs do not need most of the information that is usually stored by the receivers: they need as a minimum phase, code, and time in the above-mentioned definitions, and some station-related information like station name, antenna height, antenna model, etc.

Three major format versions of RINEX have been developed and published to date:

- The original RINEX Version 1 presented at and accepted by the 5th International Geodetic Symposium on Satellite Positioning in Las Cruces, 1989. [Gurtner et al., 1989], [Evans, 1989]
- RINEX Version 2 presented at and accepted by the Second International Symposium of Precise Positioning with the Global Positioning System in Ottawa, 1990, mainly adding the possibility to include tracking data from different satellite systems (GLONASS, SBAS). [Gurtner and Mader, 1990a, 1990b], [Gurtner, 1994]
- RINEX Version 3 developed in the early 2000s to support multi-GNSS and to clearly identified the tracking modes of each of the observations by introducing and defining 3-character observation codes for all GNSS constellations.
- RINEX Version 4 introduced in 2021 as a necessary step to support the modern multi-GNSS navigation messages by introducing and defining navigation ‘data records’ to hold both individual satellite navigation messages, constellation-wide parameters and global parameters as transmitted by the different GNSS constellations.

Several subversions of RINEX Version 2 were defined over time:

- Version 2.10: Among other minor changes, allowing for sampling rates other than integer seconds and including raw signal strengths as new observables. [Gurtner, 2002]
- Version 2.11: Includes the definition of a two-character observation code for L2C pseudoranges and some modifications in the GEO NAV MESS files. [Gurtner and Estey, 2005] - **This was the last official RINEX Version 2**
- Version 2.20: Unofficial version used for the exchange of tracking data from spaceborne receivers within the IGS LEO pilot project. [Gurtner and Estey, 2002]

In the early 2000s when new GNSS constellations were being planned, and soon thereafter started transmitting their new navigation signals, it was clear that RINEX 2 was not capable of fully supporting the new signals, tracking modes and satellites efficiently. The new BeiDou, Galileo, QZSS, etc. and the modernized GPS and GLONASS with new frequencies and observation types needed a leap in the RINEX format.

Especially the possibility to track frequencies on different channels, required a more flexible and more detailed definition of the observation codes.

Several versions of RINEX 3 have been defined:

- RINEX 3.00 (2007) fully supports multi-GNSS observation data storage. The initial RINEX Version 3 also incorporates the version 2.20 definitions for space-borne receivers.
- RINEX 3.01 (2009) introduced the requirement to generate consistent phase observations across different tracking modes or channels, i.e. to apply ¼-cycle shifts prior to RINEX file generation, if necessary, to facilitate the processing of such data.
- RINEX 3.02 (2013) added support for the Japanese, Quasi Zenith Satellite System (QZSS), additional information concerning BeiDou (based on the released ICD) and a new message to enumerate GLONASS code phase biases.
- RINEX 3.03 (2015) adds support for the NavIC/IRNSS and clarifies several implementation issues in 3.02. RINEX 3.03 also changes the BeiDou B1 signal convention back to the 3.01 convention where all B1 signals are identified as C2x (not C1 as in RINEX 3.02). Another issue with the implementation of 3.02 was the GPS navigation message fit interval field. Some implementations wrote the flag and others wrote a time interval. This release specifies that the fit interval should be a time period for GPS and a flag for QZSS. The Galileo Navigation section was updated to clarify the Issue of Data (IOD). RINEX 3.03 was also modified to specify that only known observation tracking modes can be encoded in the standard.
- RINEX 3.04 (2018) adds clarifications for signal tables for GLONASS, QZSS and BeiDou, and a small number of edits and corrections needed from the previous version
- RINEX 3.05 (2020) is a major restructure and revision of the format document to make it clearer and easier to read, it adds BeiDou signals and tracking codes to fully support BDS-2 and BDS-3, and it also adds missing flags and values to the GLONASS navigation messages. **This was the last of the RINEX version 3 format series.**

RINEX 4.00 is launched in 2021 after a very significant effort over years from the DLR/GSOC group led by Dr O. Montenbruck to modernize the GNSS Navigation message format. This effort has analyzed all the existing GNSS ICDs to identify the missing navigation message data elements from the different signals.

Furthermore, the DLR/GSOC group decoded raw navigation data frames and the internal receiver binary format files from several vendors and wrote the values into preliminary formats which served as the basis for the RINEX Working Group Navigation Taskforce discussions during the first half of 2021. These efforts form the bulk of the navigation message improvements introduced in this RINEX version and the entire GNSS community is grateful to them.

3 GENERAL FORMAT DESCRIPTION

The RINEX 4 format consists of three ASCII file types:

1. Observation data file
2. Navigation message file
3. Meteorological data file

Each file type consists of a header section and a data section. The header section contains global information for the entire file and is placed at the beginning of the file. The header section contains **header labels in columns 61-80** for each line. These labels are mandatory and must appear exactly as given in these descriptions and examples. The header does not have a fixed length and many of the labels are optional depending on the application. Comments can be added freely in the header.

The format has been optimized for minimum space requirements independent from the number of different observation types of a specific receiver or satellite system by indicating in the header the types of observations to be stored for this observation session, and the satellite systems having been observed. In computer systems allowing variable record lengths, the observation records may be kept as short as possible. Trailing blanks can be removed from the records. There is no maximum record length limitation for the observation records.

Each Observation file and each Meteorological Data file basically contain the data from one site and one session. Although the format allows for the insertion of certain header records into the data section, it is not recommended to concatenate data from more than one receiver (or antenna) into the same file, even if the data do not overlap in time.

If data from more than one receiver have to be exchanged, it would not be economical to include the identical satellite navigation messages collected by the different receivers several times. Therefore, the navigation message file from one receiver may be exchanged or a composite navigation message file created, containing non-redundant information from several receivers in order to make the most complete file.

RINEX 4 mixed navigation message files are expected to contain navigation messages of all tracked navigation satellite systems, so as to make the exchange and processing of navigation data more efficient.

The header and data record format descriptions as well as examples for each file type are given in the Appendix Tables of Section 8 at the end of the document.

4 BASIC DEFINITIONS

GNSS observables include three fundamental quantities that need to be defined: Time, Phase, and Range.

4.1 Time

The time of the measurement is the receiver time of the received signals. The time of the measurement is considered identical for all of them (phase, pseudorange, etc) and considered identical for all satellites observed at that epoch.

For single-system data files, the time of measurement is by default expressed in the system time of the respective satellite system.

For mixed files, the actual system time used **must** be indicated in the **TIME OF FIRST OBS** header record (Table A2). The details of each GNSS Time and their use in RINEX is defined below.

Each GNSS maintains a system time that is distinct from any particular UTC reference but is steered or linked to some such reference as designated by the respective ICDs. The details of each GNSS system time and their use in RINEX is defined below.

4.1.1 GPS Time

GPS time is steered to UTC(USNO), i.e. the local realization of UTC maintained by the United States Naval Observatory (USNO). But it is a continuous time scale, i.e. it does not insert any leap seconds. GPS time is usually expressed in GPS weeks and GPS seconds past 00:00:00 (midnight) Saturday/Sunday. GPS time started with week zero at 00:00:00 UTC (midnight) on January 6, 1980.

The GPS week is transmitted by the satellites as a 10-bit number. It has a roll-over after week 1023. The first roll-over happened on August 22, 1999, 00:00:00 GPS time.

In order to avoid ambiguities, the GPS week reported in the RINEX navigation message files is a continuous number without roll-over, i.e. ...1023, 1024, 1025, ...

RINEX uses **GPS** as system time identifier for the reported GPS time.

4.1.2 GLONASS Time

GLONASS time is basically running on UTC(SU) (or, more precisely, GLONASS system time linked to UTC(SU)), i.e. the time tags are given in UTC and not GPS time. It is not a continuous time, i.e. it introduces the same leap seconds as UTC.

The reported GLONASS time has the same hours as UTC and not UTC+3 h as the original GLONASS System Time.

RINEX uses **GLO** as system time identifier for the reported GLONASS time.

4.1.3 Galileo System Time

Galileo runs on Galileo System Time (GST), which is steered to a UTC realization from an ensemble of clocks maintained at several metrological institutes in Europe by the Galileo Time Service Provider. Apart from small differences (tens of nanoseconds), GST is nearly identical to GPS Time in that:

- The Galileo week starts at midnight Saturday/Sunday at the same second as the GPS week
- The GST week as transmitted by the satellites is a 12-bit value with a roll-over after week 4095. The GST week started at zero at the first roll-over of the broadcast GPS week after 1023, i.e. at Sun, 22-Aug-1999 00:00:00 GPS time

In order to remove possible misunderstandings and ambiguities, the Galileo week reported in the RINEX navigation message files is a continuous number without roll-over, i.e., ...4095, 4096, 4097,... and *it is aligned to the GPS week*.

RINEX uses **GAL** as system time identifier for the reported Galileo time.

4.1.4 BeiDou Time

The **BDS** Time (BDT) System is a continuous timekeeping system which is steered to UTC(NTSC). BDT zero time started at 00:00:00 UTC on January 1st, 2006 (GPS week 1356) therefore BDT is 14 seconds behind GPS time. BDT is synchronized with UTC within 100 nanoseconds (modulo 1 second).

- The **BDT** week starts at midnight Saturday/Sunday
- The **BDT** week is transmitted by the satellites as a 13-bit number. It has a roll-over after week 8191. In order to avoid ambiguities, the BDT week reported in the RINEX navigation message files is a continuous number without roll-over, i.e. ...8191, 8192, 8193, ...

RINEX uses **BDT** as system time identifier for the reported BDS time.

4.1.5 QZSS Time

QZSS runs on QZSS time, which is steered to UTC(NICT), i.e. the local realization of UTC maintained by the Japan National Institute of Information and Communications Technology (NICT). QZSS time is aligned with GPS time (offset from TAI by integer seconds); the QZSS week number is defined with respect to the GPS week.

RINEX uses **QZS** as a system time identifier for the reported QZSS time.

4.1.6 NavIC System Time

NavIC/IRNSS runs on Indian Regional Navigation Satellite System Time (**IRNSST**) which is steered to UTC(NPLI). The **IRNSST** start epoch is 00:00:00 on Sunday August 22nd, 1999, which corresponds to August 21st, 1999, 23:59:47 UTC (same time as the first GPS week roll over). Seconds of week are counted from 00:00:00 **IRNSST** hours Saturday/Sunday midnight which also corresponds to the start of the GPS week. Week numbers are consecutive from the start time and will roll over after week 1023 (at the same time as GPS and QZSS roll over).

RINEX uses **IRN** as the system time identifier for the reported NavIC/IRNSS time.

4.1.7 GNSS Time Relationships

Apart from the small, sub-microsecond differences, in the realizations of the different system times, the GNSS time scales differ from UTC and each other by integer seconds. The relations between the various systems are summarized in Table 1 and Table 2.

In order to have the current number of leap seconds available, we recommend including ΔtLS by adding a **LEAP SECOND** header line into the RINEX Observation file header (see Table A2).

The **LEAP SECOND** header line is now compulsory in the RINEX Navigation file header (see Table A7).

In a multi-GNSS RINEX file (GPS/GLONASS/Galileo/QZSS/BDS/NavIC) all pseudorange observations must refer to one receiver clock only.

Table 1 : Constellation Time Relationships

GLO	=	UTC	=	GPS	-	ΔtLS
GPS	=	GAL	=	UTC	+	ΔtLS
GPS	=	QZS	=	UTC	+	ΔtLS
GPS	=	IRN	=	UTC	+	ΔtLS
BDT	=			UTC	+	ΔtLS_{BDS}

Table 2 : GPS and BeiDou UTC Leap Second Relationship

ΔtLS	=	Delta time between GPS and UTC due to leap seconds, as transmitted by the GPS satellites in the almanac;
		1999-01-01 - 2006-01-01: $\Delta tLS = 13$ seconds
		2006-01-01 - 2009-01-01: $\Delta tLS = 14$ seconds
		2009-01-01 - 2012-07-01: $\Delta tLS = 15$ seconds
		2012-07-01 - 2015-07-01: $\Delta tLS = 16$ seconds
		2015-07-01 - 2017-01-01: $\Delta tLS = 17$ seconds
		2017-01-01 - ???-??-??: $\Delta tLS = 18$ seconds
ΔtLS_{BDS}	=	Delta time between BDT and UTC due to leap seconds, as transmitted by the BDS satellites in the almanac. $\Delta tLS_{BDS} = \Delta tLS - 14$ seconds
		2006-01-01 - 2009-01-01: $\Delta tLS_{BDS} = 0$ seconds
		2009-01-01 - 2012-07-01: $\Delta tLS_{BDS} = 1$ seconds
		2012-07-01 - 2015-07-01: $\Delta tLS_{BDS} = 2$ seconds
		2015-07-01 - 2017-00-01: $\Delta tLS_{BDS} = 3$ seconds
		2017-01-01 - ???-??-??: $\Delta tLS_{BDS} = 4$ seconds

Unknown biases will have to be solved for during the post processing.

The small differences (modulo 1 second) between: BDS system time, Galileo system time, GLONASS system time, UTC(SU), UTC(USNO) and GPS system time have to be dealt with during the post-processing and not before the RINEX conversion. It may also be necessary to solve for remaining differences during the post-processing.

4.1.8 GNSS Week numbers

The use of the week number from the start of a GNSS service is a common time reference. The relationships between the different GNSS week numbers are as shown in Table 3.

Table 3 : Week Numbers between RINEX and GPS, QZSS, IRN, GST, GAL, BDS

Constellation /Archival Time Representation	GPS Ephemeris Week Period #1	GPS Ephemeris Week Period #2	GPS Ephemeris Week Period #3	GPS Ephemeris Week Period #4	GPS Ephemeris Week Period #5	GPS Ephemeris Week Period #6
GPS Broadcast	0 – 1023	0 – 1023	0 – 1023	0 – 1023	0 – 1023	0 – 1023
QZSS Broadcast		0 – 1023	0 – 1023	0 – 1023	0 – 1023	0 – 1023
NavIC/IRNSS Broadcast		0 – 1023	0 – 1023	0 – 1023	0 – 1023	0 – 1023
GST Broadcast		0 – 1023	1024 – 2047	2048 – 3071	3072 – 4095	0 – 1023
BDS Broadcast and RINEX		0(RINEX Week 1356) – 691	692 – 1715	1716 – 2739	2740 – 3763	3764 – 4787
GPS/QZS/IRN/ GAL RINEX	0 – 1023	1024 – 2047	2048 – 3071	3072 – 4095	4096 – 5119	5120 -6143

4.2 Pseudorange

The pseudorange (PR) is the distance from the receiver antenna to the satellite antenna including receiver and satellite clock offsets (and other biases, such as atmospheric delays):

$$PR = \text{distance} + c * (\text{receiver clock offset} - \text{satellite clock offset}) + \text{other biases}$$

so that the pseudorange reflects the actual behavior of the receiver and satellite clocks. The pseudorange is stored in units of meters. In the above relation, $c = 299\,792\,458$ m/s denotes the speed of light.

In a mixed-mode GPS/GLONASS/Galileo/QZSS/BDS receiver all pseudorange observations must refer to one receiver clock only. RINEX pseudoranges must be corrected depending on the receiver tracking time, as shown in Table 4, to remove the contributions of the leap seconds from the pseudo-ranges.

Table 4 : Constellation Pseudorange Corrections

PR_mod(GPS)	=	PR(GPS)	+	$c * \Delta tLS$	if generated with a receiver clock running in the GLONASS time frame
PR_mod(GAL)	=	PR(GAL)	+	$c * \Delta tLS$	if generated with a receiver clock running in the GLONASS time frame
PR_mod(BDT)	=	PR(BDT)	+	$c * \Delta tLS_{BDS}$	if generated with a receiver clock running in the GLONASS time frame
PR_mod(GLO)	=	PR(GLO)	-	$c * \Delta tLS$	if generated with a receiver clock running in the GPS or GAL time frame
PR_mod(GLO)	=	PR(GLO)	-	$c * \Delta tLS_{BDS}$	if generated with a receiver clock running in the BDT time frame
PR_mod(GPS)	=	PR(GPS)	+	$c * (\Delta tLS - \Delta tLS_{BDS})$	if generated with a receiver clock running in the BDT time frame

ΔtLS is the actual number of leap seconds between GPS/GAL and GLO time, as broadcast in the respective navigation messages and distributed in Circular T of BIPM.

ΔtLS_{BDS} is the actual number of leap seconds between BDT and UTC time, as broadcast in the BeiDou navigation message.

4.3 Phase

The phase observable provided in a RINEX file is the carrier-phase range from the antenna to a satellite measured in whole cycles. Half-cycle phase measurements by squaring-type receivers must be converted to whole cycles and flagged by the respective observation code (see section 5.2.13 for further clarification).

The phase changes with the pseudorange (i.e. if the pseudorange increases with time, the phase increases as well). The phase observations between epochs must be connected by including the integer number of cycles.

If necessary, phase observations have to be corrected for phase shifts so as to be aligned to the referenced signal as indicated in Table A39. This is needed to guarantee consistency between phases of the same frequency and satellite system based on different signal channels.

If the receiver or the converter software adjusts the measurements using the real-time-derived receiver clock offsets $dT(r)$, the consistency of the 3 quantities phase / pseudorange / epoch must be maintained, i.e. the receiver clock correction shall be applied to all observables as specified in Table 5.

Table 5: Observation Corrections for Receiver Clock Offset

Time (corr)	=	Time(r)	-	$dT(r)$
PR (corr)	=	PR (r)	-	$dT(r)*c$
phase (corr)	=	phase (r)	-	$dT(r)*freq$
Doppler (corr)	=	Doppler (r)	-	$d\dot{T}(r)*freq$

4.4 Doppler

The sign of the Doppler shift as additional observable is defined as usual; positive for approaching satellites.

4.5 Satellite numbers

For clear unambiguous identification, individual satellites are identified in RINEX files by a two-digit number indicating the PRN code or the slot number. This number is preceded by a one-character system identifier **s** as shown in Figure 1.

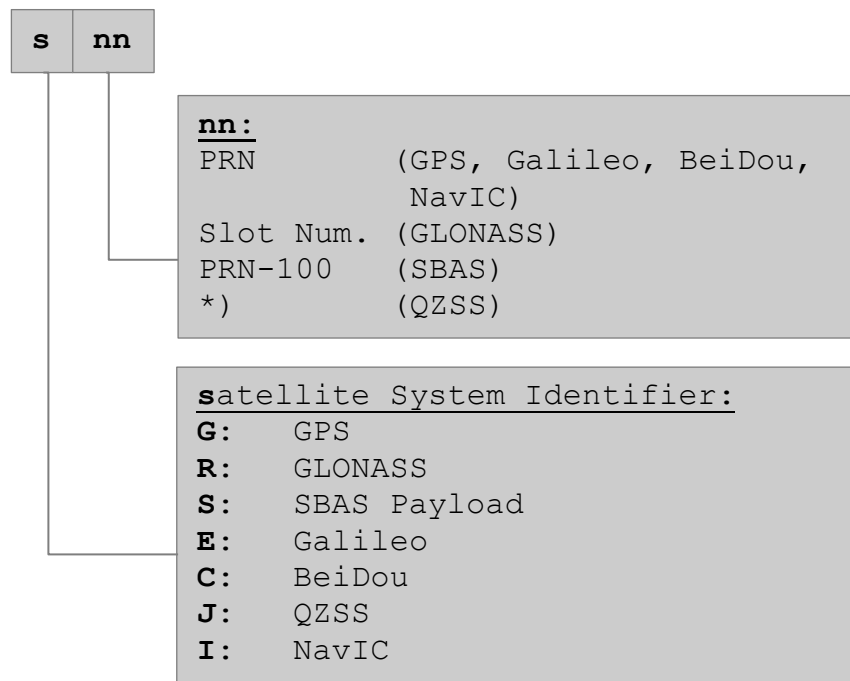

Figure 1: Satellite numbers and Constellation Identifiers

The same satellite system identifiers are also used in all header and data records when appropriate.

*) QZSS satellites make use of signal-specific PRN codes. In RINEX files, QZSS satellites are therefore distinguished by the space vehicle identifier (SV ID) as used in the QZSS LNAV almanac. The mapping of QZSS RINEX designators (**J01-J10**) and QZSS PRNs for individual signals is shown in Table 6.

Table 6: QZSS PRN to RINEX Satellite Identifier

RINEX Satellite ID	Standard PNT Signals / Centimeter Level Augmentation	Standard PNT Signals	Sub-meter Level Augmentation	Centimeter Level Augmentation for Experiments	Positioning Technology Verification Service
	Nominal	L1 C/B	L1-SAIF / L1S	L6E	L5S
J01	193		183	203	
J02	194		184	204	184

J09	201	206		211	206
J10	202	202		212	

5 RINEX VERSION 3 AND 4 FEATURES

This chapter contains description and explanations of the RINEX 3 and 4 main features; recommended filenames, the main header elements including the observation codes for each GNSS Constellation, the observation data records, and the navigation files.

5.1 Long Filenames

From RINEX 3.02 onwards the data filenames are recommended to use the proposed long filenames to be more descriptive, flexible and extensible than the previous RINEX short file naming convention. RINEX file naming recommendations are strictly speaking not part of the RINEX format definition. However, they significantly facilitate the exchange of RINEX data in large user communities like IGS, EUREF, APREF, SIRGAS, etc.

The filename recommendations herein, and fully described in Table A1, are included for convenience as they have been agreed across many institutions. Each organization can use or adapt these names as they see fit, or use any other file naming scheme, this has no material effect on the RINEX file format.

Table 7 lists example filenames for GNSS observation and navigation files. Please note that the source of the data, the start time, the duration, the cadence and the data type are now easily visible in the filename to ease in sorting, storing and identifying data files.

This proposed naming scheme allows files from the same station over the same time period, different sources, different cadences and with different observation types to be stored together easily. See Table A1 for the full description of the file naming convention.

Table 7: Examples of long filenames for RINEX 3 data files

File Name	Comments
ALGO00CAN_R_20121601000_01H_01S_MO.rnx	Mixed RINEX GNSS observation file containing 1 hour of data, with an observation every second
ALGO00CAN_R_20121601000_15M_01S_GO.rnx	GPS RINEX observation file containing 15 minutes of data, with an observation every second
ALGO00CAN_R_20121601000_01D_30S_MO.rnx	Mixed RINEX GNSS observation file containing 1 day of data, with an observation every 30 seconds
ALGO00CAN_R_20121600000_01D_MN.rnx	RINEX mixed navigation file, containing one day's data

5.2 Observation File Header

See Table A2 for a detailed specification of the RINEX 4 observation file header. This section provides general descriptions and clarifications for the observation file header.

5.2.1 Order of the header records

As the header record descriptors in columns 61-80 are mandatory, the software reading a RINEX 4 header must decode the header records with formats according to the record descriptor in Table A2.

RINEX allows the free ordering of the header records, with the following exceptions:

- The **RINEX VERSION / TYPE** record must be the first record in a file.
- The **PGM / RUN BY / DATE** line must be the second record(line) in all RINEX files. In RINEX Observation files additional records of this type from previous file modifications or updates can be stored if needed as the lines immediately following the second line.
- The **SYS / # / OBS TYPES** record(s) should precede any **SYS / DCBS APPLIED** and **SYS / SCALE FACTOR** records.
- The **# OF SATELLITES** record (if present) should be immediately followed by the corresponding number of **PRN / # OF OBS** records.
- The **END OF HEADER** of course is the last record in the header.

5.2.2 Date/Time format in the PGM / RUN BY / DATE header record

The format of the generation time of the RINEX files stored in the second header line **PGM / RUN BY / DATE** is defined to be:

yyyymmdd hhmmss zone

zone: 3 – 4 character code for the time zone

It is recommended to use **UTC** as the time zone. Set **zone** to **LCL** if an unknown local time was used.

In RINEX Observation files additional **PGM / RUN BY / DATE** header lines can appear immediately after the second line if needed to preserve the history of previous actions on the file.

5.2.3 Marker type

To indicate the nature of the marker, a **MARKER TYPE** header record has been defined. Proposed keywords are given in Table 8.

The record is required except for **GEODETIC** and **NON_GEODETTIC** marker types.

Attributes other than **GEODETIC** and **NON_GEODETTIC** will tell the user program that the data were collected by a moving receiver.

The inclusion of a “start moving antenna” record (event flag ‘2’) into the data body of the RINEX file is therefore not necessary. However, event flags ‘2’ and ‘3’ (See Table A3) are necessary to flag alternating kinematic and static phases of a receiver visiting multiple earth-fixed monuments. Users may define other project-dependent keywords.

Table 8: Predefined Marker Type Keywords

Marker Type	Description
GEODETIC	Earth-fixed high-precision monument
NON_GEODETTIC	Earth-fixed low-precision monument
NON_PHYSICAL	Generated from network processing
SPACEBORNE	Orbiting space vehicle
AIRBORNE	Aircraft, balloon, etc.

Marker Type	Description
WATER_CRAFT	Mobile water craft
GROUND_CRAFT	Mobile terrestrial vehicle
FIXED_BUOY	“Fixed” on water surface
FLOATING_BUOY	Floating on water surface
FLOATING_ICE	Floating ice sheet, etc
GLACIER	“Fixed” on a glacier
BALLISTIC	Rockets, shells, etc
ANIMAL	Animal carrying a receiver
HUMAN	Human being

5.2.4 Antenna references, phase centers

We distinguish between;

- The *Marker*, i.e. the geodetic reference monument, on which an antenna is mounted directly with forced centering or on a tripod.
- The *Antenna Reference Point* (ARP), i.e., a well-defined point on the antenna, e.g., the center of the bottom surface of the preamplifier. The antenna height is measured from the marker to the ARP and reported in the **ANTENNA: DELTA H/E/N** header record. Small horizontal eccentricities of the ARP with respect to the marker can be reported in the same record. On vehicles, the position of the ARP is reported in the body-fixed coordinate system in an **ANTENNA: DELTA X/Y/Z** header record.
- The *Average Phase Center*: A frequency-dependent and minimum elevation-angle-dependent position of the average phase center above the antenna reference point. Its position is important to know in mixed-antenna networks. It can be given in an absolute sense or relative to a reference antenna using the optional header record: **ANTENNA: PHASECENTER**. For fixed stations the components are in north/east/up direction, on vehicles the position is reported in the body-fixed system X,Y,Z.
- The *Orientation* of the antenna: The “zero direction” should be oriented towards north on fixed stations. Deviations from the north direction can be reported with the azimuth of the zero-direction in an **ANTENNA: ZERODIR AZI** header record. On vehicles, the zero-direction is reported as a unit vector in the body-fixed coordinate system in an **ANTENNA: ZERODIR XYZ** header record. The zero direction of a tilted antenna on a fixed station can be reported as unit vector in the left-handed north/east/up local coordinate system in an **ANTENNA: ZERODIR XYZ** header record.
- The *Boresight Direction* of an antenna on a vehicle: The “vertical” symmetry axis of the antenna pointing towards the GNSS satellites. It can be reported as unit vector in the body-fixed coordinate system in the **ANTENNA: B.SIGHT XYZ** record. A tilted antenna on a fixed station could be reported as unit vector in the left-handed north/east/up local coordinate system in the same type of header record.

In order to interpret the various positions correctly, it is important that the **MARKER TYPE** record be included in the RINEX header.

5.2.5 Antenna phase center header record

An *optional* header record for antenna phase center positions **ANTENNA: PHASECENTER** is defined to allow for higher precision positioning without need of additional external antenna information. It contains the position of an *average* phase center relative to the antenna reference point (ARP) for a specific frequency and satellite system.

On vehicles, the phase center position can be reported in the body-fixed coordinate system (**ANTENNA: DELTA X/Y/Z**), see section 5.2.4.

See section 5.2.10 regarding the use of phase center variation corrections.

5.2.6 Antenna orientation

Dedicated header records have been defined to report the orientation of the antenna zero-direction; **ANTENNA: ZERODIR**, as well as the direction of its vertical axis (bore-sight) if mounted tilted on a fixed station; **ANTENNA: B.SIGHT**.

The header records can also be used for antennas on vehicles.

5.2.7 Information about receivers on a vehicle

For the processing of data collected by receivers on a vehicle, the following additional information can be provided by special header records:

- Antenna position (position of the antenna reference point) in a body-fixed coordinate system: **ANTENNA: DELTA X/Y/Z**
- Boresight of antenna: The unit vector of the direction of the antenna axis towards the GNSS satellites. It corresponds to the vertical axis on earth-bound antenna: **ANTENNA: B.SIGHT XYZ**
- Antenna orientation: Zero-direction of the antenna. Used for the application of “azimuth”-dependent phase center variation models (see section 5.2.4): **ANTENNA: ZERODIR XYZ**
- Current center of mass of the vehicle (for space borne receivers): **CENTER OF MASS: XYZ**
- Average phase center position: **ANTENNA: PHASECENTER** (see 5.2.5)

All three quantities have to be given in the same body-fixed coordinate system. The attitude of the vehicle has to be provided by separate attitude files in the same body-fixed coordinate system.

5.2.8 Time of First/Last Observations

The header records **TIME OF FIRST OBS** and (if present) **TIME OF LAST OBS** in pure GPS, GLONASS, Galileo, QZSS, BeiDou, or NavIC observation files can contain the system time identifier defining the system that all time tags in the file are referring to:

- **GPS** to identify GPS time
- **GLO** to identify the GLONASS UTC time
- **GAL** to identify Galileo time
- **QZS** to identify QZSS time
- **BDT** to identify BDS time
- **IRN** to identify NavIC/IRNSS time

Pure GPS observation files default to **GPS**, pure GLONASS files default to **GLO**, pure Galileo files default to **GAL**, pure BDS observation files default to **BDT**, etc.

Multi-GNSS observation files **must** contain the system time identifier (one of the above) that all time tags refer to.

5.2.9 Corrections of differential code biases (DCBs)

For special applications, it might be useful to generate RINEX files with corrections of the satellite differential code biases (DCBs) already applied.

This can be reported by special header records **SYS / DCBS APPLIED** pointing to the file containing the applied corrections (Table A2).

5.2.10 Corrections of antenna phase center variations (PCVs)

For precise applications it is recommended that elevation-dependent, or elevation and azimuth-dependent Phase Center Variation (PCV) model for the antenna (referring to the agreed-upon ARP) be used during the processing.

For special applications, it might be useful to generate RINEX files with these PCV corrections already applied. This can be reported by special header records **SYS / PCVS APPLIED** pointing to the file containing the PCV correction models.

5.2.11 Scale factor

The *optional* **SYS / SCALE FACTOR** header record allows the storage of phase data with 0.0001 of a cycle resolution, if the data was multiplied by a scale factor of 10 before being stored into the RINEX file. This feature is used to increase resolution by 10, 100, etc only.

5.2.12 Phase Cycle Shifts

Carrier phases tracked on different signal channels or modulation bands of the same frequency in a GNSS constellation may differ in phase by 1/4 (e.g., GPS: P/Y-code-derived L2 phase vs. L2C-based phase), or by other fractional parts of a cycle. To facilitate consistent processing of all signals across different receiver platforms and applications, such phase differences must be compensated at or before the generation of RINEX observation files.

By convention, phase observations in RINEX files must always be aligned to a predefined reference signal. Table A39 specifies the reference signal for each frequency and constellation, and which signals shall align to the reference. This alignment of phases allows interoperability between different signals in the same frequency. There is no ambition to align phases across constellations.

The **SYS / PHASE SHIFT** header lines are now optional in the RINEX observation files and strongly deprecated. They are retained in the RINEX observation file header definition (Table A2) for compatibility with previous RINEX versions but they should be ignored by RINEX decoders and encoders.

5.2.13 Half-wavelength observations, half-cycle ambiguities

Half-wavelength observations of encrypted GPS P(Y)-code signals collected by **codeless** squaring techniques get their own observation codes, see section 5.2.17. If a receiver changed between squaring and full cycle tracking within the time period of a RINEX file, observation

codes for both types of observations have to be inserted into the respective **SYS / # / OBS TYPES** header record.

Half-wavelength phase observations are stored in full cycles. Ambiguity resolution, however, has to account for half wavelengths!

Full-cycle observations collected by receivers with possible half cycle ambiguity (e.g., during acquisition or after loss of lock) are to be flagged with Loss of Lock Indicator bit 1 set (see Table A3). *Note*: The loss of lock bit is the least significant bit.

5.2.14 Receiver clock offset

A receiver-derived clock offset can be optionally reported in the RINEX observation files. In order to remove uncertainties about whether the data (epoch, pseudorange, phase) have been corrected or not by the reported clock offset, use the header record: **RCV CLOCK OFFS APPL**.

5.2.15 Satellite system-dependent list of observables

The order of the observations stored per epoch and satellite in the observation records is given by a list of observation codes in a header record.

As the types of the observations actually generated by a receiver may heavily depend on the satellite system, RINEX 4.00 requires system-dependent observation code lists (header record type **SYS / # / OBS TYPES**), see a full description of all observation types in section 5.2.17.

5.2.16 GLONASS Code-Phase Alignment Header Record

Some GNSS receivers may produce biased GLONASS observations. The bias is a result of the code and phase observations not being taken at the same instant.

Phase data from GNSS receivers that issue biased data must be corrected to remove the bias.

The GLONASS CODE/PHASE BIAS (**GLONASS COD/PHS/BIS**) header record is now optional and deprecated since RINEX data file users need the data corrected but do not generally care what the correction applied was, and since the corrections may not be known at the time of RINEX file writing.

This deprecated GLONASS code-phase alignment header line contains the C1C, C1P, C2C and C2P corrections. See Table A2 for details.

5.2.17 Observation codes

Dedicated observation codes are used in RINEX to distinguish individual signals and tracking modes. In order to keep the observation codes short, but still allow for a detailed characterization of the actual signal generation, the observation codes are composed of three characters/digits “**tna**” as detailed in Table 9.

Table 9 : Observation Code Components

t : observation type	C = pseudo-range	L = carrier phase	D = doppler	S = signal strength	X = channel number
n : band / frequency	1, 2,...,9				
a : attribute	tracking mode or channel, e.g., I , Q , C , P , etc.				

Examples:

- **L1C**: C/A code-derived L1 carrier phase (GPS, GLONASS) Carrier phase on E2-L1-E1 derived from C channel (Galileo)
- **C2L**: L2C pseudorange derived from the L channel (GPS)
- **C2X**: L2C pseudorange derived from the mixed (M+L) codes (GPS)

Blank (unknown) observation attributes (tracking modes or channels) are not supported from RINEX 3.02 onwards. Except for the ‘**x**’ pseudo-observations (see section 5.3.4) which indicate the receiver channel number(s) tracking the specific satellite, and have blank a ‘attribute’ value.

For satellite observations only the complete specification of all signals is allowed i.e. all three fields must be specified. RINEX observation codes for all supported frequencies, signals and tracking modes for all GNSS constellations are detailed in Table 10 to Table 16.

Table 10 : RINEX Version 4.00 GPS Observation Codes

GNSS System	Freq. Band / Frequency	Channel or Code	Observation Codes			
			Pseudo Range	Carrier Phase	Doppler	Signal Strength
GPS	L1/1575.42	C/A	C1C	L1C	D1C	S1C
		L1C (D)	C1S	L1S	D1S	S1S
		L1C (P)	C1L	L1L	D1L	S1L
		L1C (D+P)	C1X	L1X	D1X	S1X
		P (AS off)	C1P	L1P	D1P	S1P

		Q	C5Q	L5Q	D5Q	S5Q
		I+Q	C5X	L5X	D5X	S5X

Antispoofing (AS) of GPS: Various techniques may be used by GPS receivers to track the encrypted GPS P(Y)-Code during Antispoofing (AS). In view of different properties of the resulting observations, which need to be considered in the observation modelling, RINEX

offers multiple attributes to unambiguously distinguish the respective observations. True codeless GPS receivers (squaring-type receivers) use the attribute **N**. Semi-codeless receivers tracking the first frequency using C/A code and the second frequency using some codeless options use attribute **D**. Z-tracking under AS or similar techniques to recover pseudorange and phase on the “P-code” band use attribute **W**. Y-code tracking receivers (e.g. units employing a Selective Availability Anti-Spoofing Module (SAASM)) use attribute **Y**.

Table 11 : RINEX Version 4.00 GLONASS Observation Codes

GNSS System	Freq. Band / Frequency	Channel or Code	Observation Codes

5.3 Observation Data Records

See section 8 for a detailed specification of the RINEX data record description. Below are some descriptions and clarifications for some of the data records elements.

Each observation record begins with the satellite identifier **snn** (see section 4.5), the epoch record starts with special character **>**. It is now also much easier to synchronize the reading program with the next epoch record in case of a corrupted data file or when streaming observation data in a RINEX-like format.

There is no data record length limitation as it depends on the declared constellation observation list and the available observables per satellite per epoch.

Table 17 shows a sample list of observation types for six satellite systems **G, E, S, R, C, J**.

Table 17 : Example Observation Type Records

G	22	C1C	L1C	D1C	S1C	C1W	S1W	C2W	L2W	D2W	S2W	C2L	L2L	D2L	SYS / # / OBS TYPES

→8	148829334.35608		-2.392	8		49.250									

The long observation lines per satellite are wrapped to fit the table width, each new line starts with a PRN and is wrapped (indicated by →) until the next PRN (no width limitation to the satellite observation lines).

5.3.1 Order of Data records

Multiple epoch observation data records with identical time tags are not allowed (exception: Event records).

Epochs in a RINEX file have to be listed ordered in time.

5.3.2 Event flag records

Special occurrences during the tracking can be indicated in the **EPOCH** event flag in a RINEX observation file. The event flag is the integer after the number of seconds in the epoch, different such events can be indicated using integers;

- 2 - start moving antenna
- 3 - new site occupation (end of kinematic data) (at least **MARKER NAME** record follows)
- 4 - header information follows
- 5 - external event (epoch is significant, same time frame as observation time tags)

The “number of satellites” field if the event field is ≥ 2 then corresponds to the number of records of the same epoch following the **EPOCH** record. Therefore, the “number of satellites” in the **EPOCH** may be used to skip the appropriate number of data records if certain event flags are not to be evaluated in detail (Table A3).

5.3.3 RINEX observation data records for GEO & SBAS satellites

Satellite-Based Augmentation System (SBAS) payloads on GEO satellites transmitting navigation signals. The satellite identifier ‘**S**’ is to be used, as shown in Figure 1, in the **RINEX VERSION / TYPE** header line and to identify the satellite. The PRN ‘**nn**’ is defined as being the GEO PRN number minus 100;

e.g.: PRN = 120 \Rightarrow **Snn** = **S20**

5.3.4 Channel numbers as pseudo-observables

For special applications, it might be necessary to know the receiver channel numbers having been assigned by the receiver to the individual satellites and band/frequency. We may include this information as a pseudo-observable in each epoch data record line per satellite:

t : observation type:	x = Receiver channel number
n : band / frequency :	1, 2, ..., 9
a : attribute:	blank

The lowest channel number allowed is 1 (re-number channels beforehand, if necessary). In the case of a receiver using multiple channels for one satellite, the channels could be packed with two digits each right-justified into the same data field, order corresponding to the order of the observables concerned. Using a Fortran float number format F14.3 according to (<5-nc>(2X),<nc>I2.2,’.000’), *nc* being the number of channels.

Restriction: Not more than 5 channels and channel numbers <100.

Examples:

- **0910.000** for channels 9 and 10
- **010203.000** for channels 1, 2, and 3

5.4 RINEX Navigation Messages

RINEX 4.00 encourages the recording at each station of ‘Mixed’ navigation files containing all the GNSS system navigation messages. Navigation files for individual constellations are allowed but discouraged to reduce the number of files from a station.

Merged RINEX navigation files (whether from an individual station or from a station network) are described in section 6.11 and are always expected to contain the navigation messages of all the tracked satellites in mixed or individual constellation mode.

The data portion of the navigation message files contains the broadcast navigation data records scaled to engineering units and with floating point numbers. The navigation message format is similar for all satellite systems. All legacy navigation messages supported by earlier RINEX versions remain unchanged and all new navigation messages reuse the fixed grid of four columns with a width of 19 characters.

The number of records per message and the contents are constellation and signal dependent as detailed in section 8.3. Using the new Data Record Header Line which contains; a navigation record type, the satellite or constellation identifier and the navigation message type (see section 5.4.1), the reading program can determine the number of fields to be read for each data record as defined in each of the corresponding Appendix Tables.

In RINEX 4.00 constellation and global dependent navigation file contents have been removed from the header and included as specific system time correction, earth orientation and ionosphere navigation messages.

The time tags of the navigation messages (e.g., time of ephemeris, time of clock) are given in the respective satellite system time following the convention described in section 4.1.

A navigation file shall avoid storing redundant navigation messages in the RINEX file (e.g., the same message broadcast at different times, or containing exactly the same data). In case of multiple navigation data sets with identical contents, priority should be given to storing the one with the earliest transmission time.

5.4.1 Navigation Data Record Header Line

In RINEX 4.00 an initial line is included to indicate the start of a new navigation data record. This navigation data record header line contains a starting indicator “>”, a navigation data record type, the source of the data, and the message type indicator from which the data record is obtained, this is the new Data Record Header Line.

The first element, the record type, is as presented in Table 19.

Table 19: Navigation Data Record Types

Nav Data Record Type	Description
EPH	Ephemerides data including orbit, clock, biases, accuracy and status parameters.
STO	System Time and UTC proxy offset parameters
EOP	Earth Orientation Parameters
ION	Global/Regional ionospheric model parameters

The second element is the source of the navigation data record. It is indicated with the constellation letter (**G, R, E, C, J, I**), plus when necessary the two-digit satellite number of

the transmitting satellite. Redundant constellation data records coming from different satellites with the exact same values shall not be repeated.

The navigation message type indicator is the final element of the Data Record Header Line and it depends on the data record type of Table 19.

Table 20: EPH Navigation Message Types

EPH Nav Message Types	Description	Constellation and signal
LNAV	GPS/QZSS/NavIC Legacy Navigation Messages	GPS L1 C/A, QZSS L1 C/A or L1 C/B, IRNSS L5/S SPS
FDMA	GLONASS Legacy FDMA Message	GLO L1 C/A
FNAV	Galileo Free Navigation Message	GAL E5a
INAV	Galileo Integrity Navigation Message	GAL E1, E5b
D1	BeiDou-2/3 MEO/IGSO Navigation Message	BDS B1I, B2I, B3I
D2	BeiDou-2/3 GEO Navigation Message	BDS B1I, B2I, B3I
SBAS	SBAS Navigation Message	SBAS L1
CNAV	GPS/QZSS CNAV Navigation Message	GPS/QZSS L2C, L5
CNV1	BeiDou-3 CNAV-1 Navigation Message	BDS-3 B1C
CNV2	GPS/QZSS CNAV-2 Navigation Mssg BeiDou-3 CNAV-2 Navigation Message	GPS/QZSS L1C BDS-3 B2a
CNV3	BeiDou-3 CNAV-3 Navigation Message	BDS-3 B2b

Constellation or System navigation data records (**STO**, **EOP**, **ION** from Table 19) contain data commonly transmitted by different groups of navigation messages and thus the granularity of the message type indicators can be reduced to prevent many copies of the same data being repeated in a navigation file;

Table 21: STO, EOP, ION Navigation Message Types

STO, EOP, ION Nav Message Types	Description	Constellation and signal
LNAV	GPS/QZSS/NavIC Legacy Navigation Messages	GPS L1 C/A, QZSS L1 C/A or L1 C/B, IRNSS L5/S SPS
FDMA	GLONASS Legacy FDMA Navigation Message	GLO L1 C/A
IFNV	Galileo INAV or FNAV Navigation Message	GAL E1, E5a, E5b
D1D2	BeiDou-2/3 MEO/IGSO and GEO Navigation Message	BDS B1I, B2I, B3I
SBAS	SBAS Navigation Message	SBAS L1

STO, EOP, ION Nav Message Types	Description	Constellation and signal
CNVX	GPS/QZSS CNAV Navigation Message BeiDou-3 CNAV-1, CNAV-2 or CNAV-3 Navigation Message	GPS/QZSS L2C, L5 BDS-3 B1C, B2I, B3I

The navigation data message header lines are then, for example;

```
> EPH G01 LNAV
> STO R    FDMA
> ION E08 IFNV
> EOP J01 CNVX
```

5.4.2 EPH Navigation messages for GPS (LNAV, CNAV, CNV2)

The specifications for the GPS satellite navigation messages are in Table A9, Table A10, and Table A11. After the new Data Record Header Line the **LNAV** message is defined exactly as in previous RINEX versions. The first data record always contains the epoch, and satellite clock information. The following lines contain the orbit parameters for the satellite, the time of applicability of the navigation message, health flag, accuracy information, group delays, etc.

5.4.3 EPH Navigation messages for Galileo (INAV, FNAV)

The specifications for the Galileo satellite navigation message are in Table A13. The Galileo Open Service allows access to two navigation message types: **FNAV** (Free Navigation) and **INAV** (Integrity Navigation). The content of the two messages differs in various items, however, in general it is very similar to the content of the GPS (LNAV) navigation message, e.g. the orbit parameterization is the same.

There are items in the navigation message that depend on the origin of the message (**FNAV** or **INAV**): The SV clock parameters actually define the satellite clock for the dual-frequency ionosphere-free linear combination. FNAV reports the clock parameters valid for the E5a-E1 combination, the INAV reports the parameters for the E5b-E1 combination. The second parameter in the *Broadcast Orbit 5* record (bits 8 and 9) indicates the frequency pair the stored clock corrections are valid for.

RINEX file encoders shall encode one RINEX Galileo navigation message for each **FNAV** and **INAV** signal decoded. Therefore, if both messages are decoded, then the relevant bit fields must be set in the RINEX message and both should be written in separate messages. The Galileo ICD Section 5.1.9.2 indicates that some of the contents of the broadcast navigation message may change, yet the issue of data (IOD) may not change. To ensure that all relevant information is available message encoders should monitor the contents of the file and write new navigation messages when the contents have changed.

RINEX file parsers should expect to encounter **FNAV** and **INAV** messages with the same IOD in the same file. Additionally, parsers should also expect to encounter more than one **FNAV** or **INAV** ephemeris message with the same IOD, as the navigation message Data Validity Status (DVS) and other parameters may change independently of the IOD, yet some other data may be the same, however, the transmission time will be updated (See Note in Galileo ICD Section 5.1.9.2 Issue of Data).

As mentioned in section 4.1.8 the GAL week in the RINEX navigation message files is a continuous number; it has been aligned to the GPS week by the program creating the RINEX

file.

5.4.4 EPH Navigation message for GLONASS (FDMA)

The specifications for the GLONASS satellite navigation message are in Table A15. The first data record contains the epoch, and satellite clock information. The following three records contain the satellite position, velocity and acceleration, the clock and frequency biases, as well as auxiliary information such as health, satellite frequency (channel) and age of the information.

The last record includes Status and Health flags, the signal group delay difference and the accuracy index, but some of the values in the last record only apply to GLO-M/K satellites.

The corrections of the satellite time to the UTC proxy is as follows:

$$\text{GLONASS: } T_{\text{utc}} = T_{\text{sv}} + \text{TauN} - \text{GammaN} * (T_{\text{sv}} - T_{\text{b}}) + \text{TauC}$$

In order to use the same sign conventions, the broadcast GLONASS values are stored in the navigation file (in GLONASS **EPH** and **STO** messages) as: -TauN, +GammaN, -TauC.

The time tags in the GLONASS navigation files are given in UTC (i.e. **not** Moscow time nor GPS time).

5.4.5 EPH Navigation messages for QZSS (LNAV, CNAV, CNV2)

The QZSS navigation messages are defined in Table A17, Table A18 and Table A19. The messages are defined in-line with the GPS equivalent messages but for completeness and in view of some selected differences fully independent definition tables are included.

5.4.6 EPH Navigation messages for BDS (D1/D2, CNV1, CNV2, CNV3)

The BDS Open Service broadcast navigation messages are defined in Table A21, Table A22, Table A23, and Table A24. As with all other message the first data record contains epoch and satellite clock information, followed by the orbit parameters, several time parameters, and health and accuracy flags.

The BDT week number is a continuous number. The broadcast 13-bit BDS System Time week has a roll-over after 8191. It starts at zero on: 1-Jan-2006, hence;

$$\text{BDT week} = \text{BDT week}_{\text{BRD}} + (n * 8192) \text{ (Where } n: \text{ number of BDT roll-overs).}$$

5.4.7 EPH Navigation message for SBAS satellites (SBAS)

The specifications for SBAS satellite navigation message are in Table A26. Navigation data records for SBAS satellites are mainly based on the contents of the MT 9 "GEO Navigation Message" with optional health information from the MT17 "GEO Almanacs" message.

The first data record line contains the epoch and satellite clock information; the following records contain the satellite position, velocity and acceleration and auxiliary information (health, URA and IODN).

The time tags in the GEO navigation data are given in the GPS time frame, i.e. **not** UTC.

The corrections of the satellite time to UTC is as follows:

$$\text{GEO: } T_{\text{utc}} = T_{\text{sv}} - a_{\text{Gf0}} - a_{\text{Gf1}} * (T_{\text{sv}} - T_{\text{oe}}) - W_0 - \Delta t_{\text{LS}}$$

W0 being the correction to transform the GEO system time to the UTC proxy. See Toe, aGf0, aGf1 in Table A26 format definition table.

The *Transmission Time of Message* is expressed in GPS seconds of the week. It marks the beginning of the message transmission. It has to refer to the same GPS week as the *Epoch of Ephemerides*. If necessary, the *Transmission Time of Message* may have to be adjusted by - or + 604800 seconds (which would make it lower than zero or larger than 604800, respectively and then further corrected to correspond to the *Epoch of Ephemeris*) so that it is referenced to the GPS week of the *Epoch of Ephemeris*.

Health is defined as follows:

- bits 0 to 3 equal to *health* in Message Type 17 (MT17)
- bit 4 is set to 1 if MT17 health is unavailable
- bit 5 is set to 1 if the URA index is equal to 15

In the SBAS message definitions, bit 3 of the health word is currently marked as *reserved*. In case of bit 4 set to 1, it is recommended to set bits 0,1,2,3 to 1, as well.

User Range Accuracy (URA);

The same convention for converting the URA index to meters is used as with GPS. Set URA = 32767 meters if URA index = 15.

5.4.8 EPH Navigation messages for NavIC/IRNSS (LNAV)

The NavIC/IRNSS Open Service broadcast navigation message is similar in content to the GPS LNAV navigation message.

See Table A28 and Table A29 for a description and examples of each field.

5.4.9 STO Messages for System Time and UTC Offset

The STO messages replace the previous “**SYSTEM TIME CORR**” header line(s).

The STO message is defined in Table A30. GNSS satellites transmit different system time offsets. With these offsets timing information can be converted between GNSS time scales or from a GNSS time scale to a UTC proxy. Only the fractional-second parts of the respective offset are provided in the STO records. Information on full leap seconds between GPS time to UTC (since 6 Jan 1980) is contained in the “**LEAP SECONDS**” header line which is now compulsory for navigation files (see Table A7).

Table 22: Navigation Message System Time Offset labels

System		UTC	GPS	GLO	Galileo	BeiDou	QZSS	NavIC/ IRNSS
	2 letter codes	UT	GP	GL	GA	BD	QZ	IR
GPS	GP	GP ^{UT}						
GLONASS	GL	GL ^{UT}	GL ^{GP}					
Galileo	GA	GA ^{UT}	GAG ^P	GAG ^L				
BeiDou	BD	BD ^{UT}	BDG ^P	BDG ^L	BDG ^A			
QZSS	QZ	QZ ^{UT}	QZG ^P	QZG ^L	QZG ^A	QZ ^{BD}		
NavIC/IRNSS	IR	IR ^{UT}	IRG ^P	IRG ^L	IRG ^A	IR ^{BD}	IR ^{QZ}	
SBAS	SB	SB ^{UT}	SBG ^P	SBG ^L	SBG ^A	SB ^{BD}	SB ^{QZ}	SB ^{IR}

In case of the UTC time offsets, the specific UTC proxy referenced is specified by a dedicated indicator; the UTC ID.

Valid UTC ID entries include: **UTC (USNO)** , **UTC (SU)** , **UTCGAL** , **UTC (NTSC)** , **UTC (NICT)** , **UTC (NPLI)** , **UTCIRN** , **UTC (OP)** . A UTC ID is necessary, as detailed in Table 23, for every “**UT**” time offset message.

Table 23: Navigation Message System Time UTC indicator

System	UTC Offset label	UTC ID
GPS	GPUT	UTC (USNO)
GLONASS	GLUT	UTC (SU)
Galileo	GAUT	UTCGAL
BeiDou	BDUT	UTC (NTSC)
QZSS	QZUT	UTC (NICT)
NavIC/IRNSS	IRUT	UTCIRN / UTC (NPLI)
SBAS	SBUT	(From the valid UTC ID entries list, whichever applies for each SBAS system)

For Galileo, the “UTC” to which the **GAUT** offset refers to comes from an ensemble of clocks maintained at several metrological institutes in Europe by the Galileo Time Service Provider, and the designation **UTCGAL** has been adopted as the proxy for the UTC broadcast by Galileo.

For NavIC/IRNSS, which transmits two distinct offsets of NavIC/IRNSS system time with respect to both UTC and to UTC(NPLI), the correct UTC ID (**UTCIRN** or **UTC (NPLI)**) shall be used for each case.

In terms of SBAS different **SBUT** values will require different UTC IDs for each system. Thus, additionally an SBAS ID indicator must also be specified for every **SBUT** value. Current SBAS ID values are: **WAAS** , **EGNOS** , **MSAS** , **GAGAN** , **SDCM** , **BDSBAS** , **KASS** , **A-SBAS** , **SPAN** . See Table A30 for the structure of the STO message and the use of these indicators.

The time offset parameters for different constellations and navigation messages and how the parameters are to be used are indicated in Table 24.

Table 24: Time Offset Parameters per GNSS and per Navigation Message

System	STO Nav Mssg Type	Definition	Time sys offset labels (Message parameters)
GPS	LNAV	$t_{\text{GPS}} - t_{\text{UTC(USNO)}} = \Delta t_{\text{is}}^{1980} + A_0 + A_1(t - t_{\text{ot}})_{\text{GPS}}$	GPUT ($+A_0, +A_1; t_{\text{ot}}$)
	CNVX	$t_{\text{GPS}} - t_{\text{UTC(USNO)}} = \Delta t_{\text{is}}^{1980} + A_0 + A_1(t - t_{\text{ot}})_{\text{GPS}} + A_2(t - t_{\text{ot}})_{\text{GPS}}^2$	GPUT ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
		$t_{\text{GAL}} - t_{\text{GPS}} = -A_0 - A_1(t - t_{\text{ggto}})_{\text{GPS}} - A_2(t - t_{\text{ggto}})_{\text{GPS}}^2$	GAGP ($-A_0, -A_1; t_{\text{ggto}}$)
GLO	LNAV	$t_{\text{UTC(SU)}} + 3\text{h} - t_{\text{GLO}} = \tau_c$	GLUT ($-\tau_c; t_{0d}$)

System	STO Nav Mssg Type	Definition	Time sys offset labels (Message parameters)
		$t_{\text{GPS}} - t_{\text{GLO}} = -3\text{h} + \Delta t_{\text{ls}}^{1980} + \tau_{\text{GPS}}$	GLGP ($-\tau_{\text{GPS}}; t_{0\text{d}}$)
GAL	IFNV	$t_{\text{GAL}} - t_{\text{UTC}} = \Delta t_{\text{ls}}^{1980} + A_0 + A_1 \cdot (t - t_{\text{ot}})_{\text{GAL}}$	GAUT ($+A_0, +A_1; t_{\text{ot}}$)
		$t_{\text{GAL}} - t_{\text{GPS}} = A_0 + A_1 \cdot (t - t_{\text{og}})_{\text{GAL}}$	GAGP ($+A_0, +A_1; t_{\text{og}}$)
BDS	D1D2	$t_{\text{BDS}} - t_{\text{UTC(NTSC)}} = \Delta t_{\text{ls}}^{2006} + A_0 + A_1 \cdot (t - t_{0\text{w}})_{\text{BDS}}$	BDUT ($+A_0, +A_1; t_{0\text{w}}$)
		$t_{\text{BDS}} - t_{\text{GPS}} = A_0 + A_1(t - t_{0\text{w}})_{\text{BDS}}$	BDGP ($+A_0, +A_1; t_{0\text{w}}$)
		$t_{\text{BDS}} - t_{\text{GAL}} = A_0 + A_1(t - t_{0\text{w}})_{\text{BDS}}$	BDGA ($+A_0, +A_1; t_{0\text{w}}$)
		$t_{\text{BDS}} - t_{\text{GLO}} = A_0 + A_1(t - t_{0\text{w}})_{\text{BDS}}$	BDGL ($+A_0, +A_1; t_{0\text{w}}$)
	CNVX	$t_{\text{BDS}} - t_{\text{UTC(NTSC)}} = \Delta t_{\text{ls}}^{2006} + A_0 + A_1(t - t_{\text{ot}})_{\text{BDS}} + A_2(t - t_{\text{ot}})_{\text{BDS}}^2$	BDUT ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
		$t_{\text{BDS}} - t_{\text{GPS}} = A_0 + A_1(t - t_{\text{bgt0}})_{\text{BDS}} + A_2(t - t_{\text{bgt0}})_{\text{BDS}}^2$	BDGP ($+A_0, +A_1, +A_2; t_{\text{bgt0}}$)
		$t_{\text{BDS}} - t_{\text{GAL}} = A_0 + A_1(t - t_{\text{bgt0}})_{\text{BDS}} + A_2(t - t_{\text{bgt0}})_{\text{BDS}}^2$	BDGA ($+A_0, +A_1, +A_2; t_{\text{bgt0}}$)
		$t_{\text{BDS}} - t_{\text{GLO}} = A_0 + A_1(t - t_{\text{bgt0}})_{\text{BDS}} + A_2(t - t_{\text{bgt0}})_{\text{BDS}}^2$	BDGL ($+A_0, +A_1, +A_2; t_{\text{bgt0}}$)
QZSS	LNAV	$t_{\text{QZS}} - t_{\text{UTC(NICT)}} = \Delta t_{\text{ls}}^{1980} + A_0 + A_1(t - t_{\text{ot}})_{\text{QZS}}$	QZUT ($+A_0, +A_1; t_{\text{ot}}$)
	CNVX	$t_{\text{QZS}} - t_{\text{UTC(NICT)}} = \Delta t_{\text{ls}}^{1980} + A_0 + A_1(t - t_{\text{ot}})_{\text{QZS}} + A_2(t - t_{\text{ot}})_{\text{QZS}}^2$	QZUT ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
NavIC/ IRNSS	LNAV	$t_{\text{IRS}} - t_{\text{UTC}} = \Delta t_{\text{ls}}^{1980} + A_0 + A_1(t - t_{\text{ot}})_{\text{IRS}} + A_2(t - t_{\text{ot}})_{\text{IRS}}^2$	IRUT ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
		$t_{\text{IRS}} - t_{\text{UTC(NPLI)}} = \Delta t_{\text{ls}}^{1980} + A_0 + A_1(t - t_{\text{ot}})_{\text{IRS}} + A_2(t - t_{\text{ot}})_{\text{IRS}}^2$	IRUT ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
		$t_{\text{IRS}} - t_{\text{GPS}} = A_0 + A_1(t - t_{\text{ot}})_{\text{IRS}} + A_2(t - t_{\text{ot}})_{\text{IRS}}^2$	IRGP ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
		$t_{\text{IRS}} - t_{\text{GLO}} = A_0 + A_1(t - t_{\text{ot}})_{\text{IRS}} + A_2(t - t_{\text{ot}})_{\text{IRS}}^2$	IRGL ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
		$t_{\text{IRS}} - t_{\text{GAL}} = A_0 + A_1(t - t_{\text{ot}})_{\text{IRS}} + A_2(t - t_{\text{ot}})_{\text{IRS}}^2$	IRGA ($+A_0, +A_1, +A_2; t_{\text{ot}}$)
SBAS	SBAS	$t_{\text{SBAS}(i)} - t_{\text{UTC}(j)} = \Delta t_{\text{ls}}^{1980} + A_0 + A_1 \cdot (t - t_{\text{ot}})_{\text{SBAS}(i)}$	SBUT ($+A_0, +A_1; t_{\text{ot}}; i; j$) i ; SBAS ID j ; UTC ID

Where $\Delta t_{\text{ls}}^{1980} / \Delta t_{\text{ls}}^{2006}$: leap seconds since Jan.1980 / 2006; t_{ot} : reference epoch; $t_{0\text{w}}$: start-of-week epoch; $t_{0\text{d}}$: start-of-day epoch.

The reference epoch of the time offset polynomial is given in the form of a calendar date in analogy with the clock epoch of the **EPH** ephemeris records. In addition, the transmission time

is provided in field 4 of line 1 to identify, at which instant the time offset information has become available in the receiver.

The reference epoch and the transmit time refer to the system time of the originating constellation, which is identified in the **STO** record header. In accord with the conventions for ephemeris data, the epoch and transmit time of STO information transmitted by GLONASS satellites should be aligned to UTC by subtracting 3 h from the respective values in Moscow Time.

5.4.10 EOP Messages for Earth Orientation Parameters

The **EOP** messages are new in the RINEX 4.00 navigation files. The messages are defined in Table A31.

Earth orientation parameters (EOPs) are presently supported by four constellations: GPS, QZSS, NavIC/IRNSS, and BeiDou-3. In all cases pole coordinates (x, y) and ΔUT1 and the respective rates are provided for a specified reference epoch. For the GLONASS **CDMA** navigation messages, second-order derivatives will be provided for all three parameters.

The reference epoch of the **EOP** data is given in the form of a calendar date as with the clock epoch of the **EPH** ephemeris records. In addition, the transmission time of the **EOP** data is provided, at which instant the **EOP** information has become available in the receiver.

5.4.11 ION Messages for Ionosphere Model Parameters

The **ION** messages replace the previous “**IONOSPHERE CORR**” navigation message file header line(s). The ionospheric messages for the different models are defined in Table A32, Table A33, and Table A34.

To support navigation with single-frequency observations, most GNSSs transmit a system-specific set of parameters based on which navigation users can model the ionospheric slant electron content and thus correct the ionospheric path delays. The choice of model varies with constellation and navigation message type, and includes:

- The Klobuchar model used in GPS, BeiDou-2/3, QZSS, and NavIC/IRNSS
- The NeQuick-G model of Galileo
- The BDGIM model used in BeiDou-3

The Klobuchar model is jointly used by four constellations, but the model coefficients are independently determined for each of these systems. In case of regional systems such as BeiDou-2, QZSS, and NavIC/IRNSS, the model parameters are typically optimized for use in the respective service area. As a unique feature of QZSS, two independent sets of Klobuchar model coefficients for “wide area” and “Japan area” users are jointly transmitted in each of the LNAV, CNAV, and CNAV-2 messages. For other constellations, only a single parameter set is provided.

The ionosphere model parameters provided by the various GNSSs are not associated with a reference epoch or validity period.

6 RINEX FORMATTING CLARIFICATIONS

6.1 Versions

Programs developed to read RINEX files have to verify the version number and take proper action if they cannot deal with it.

Files of newer versions may look different even if they do not use any of the newer features.

6.2 Leading blanks in CHARACTER fields

When writing CHARACTER fields content should be left-justified. When reading CHARACTER fields leading and trailing white space should be discarded.

6.3 Variable-length records

In variable length records, empty data fields at the end of a record may be missing, especially in the case of the optional receiver clock offset.

6.4 Spare Fields

In view of future format evolutions, we recommend to carefully skip any fields currently defined to be Spare or left blank in the navigation message definition tables (section 8.3), because they may be assigned to new contents in future versions.

Spare fields are to be left blank so as to avoid confusion.

6.5 Missing items, duration of the validity of values

Header items that are not known at the file creation time can be set to zero or blank (Blank if Not Known/Not Defined - BNK) or the respective record may be completely omitted. Consequently, items of missing header records will be set to zero or blank by the program reading RINEX files. Trailing blanks may be truncated from the record.

Each value remains valid until changed by an additional header record.

6.6 Unknown / Undefined observation types and header records

It is a good practice for a program reading RINEX files to make sure that it properly deals with unknown observation types, header records or event flags by skipping them and/or reporting them to the user.

6.7 Floating point numbers in Observation data records

RINEX observation measures are written as floating point values with three decimals and a total field width of 14 characters (e.g. Fortran F14.3 format). Following each observation, a two-digit field for optional loss-of-lock indicator (LLI) (only for phase observation) and signal strength indicators (SSI) is provided.

Example:

PRN	code (m)	phase (cycles)
G02	22187868.655 7	116598092.03507
R09	22677458.268 6	121096420.07006

Missing observations are written as 0.0 or blanks. Phase values overflowing the fixed format F14.3 have to be clipped into the valid interval (e.g add or subtract 10^{**9}), set bit 0 of LLI indicator.

6.7.1 Loss of lock indicator (LLI)

For phase observations only. The LLI values are three-bit codes (binary 000-111) stored as decimals 0-7. Each bit has a special meaning;

0 or blank: OK or not known.

Bit 0 set: Lost lock between previous and current observation: Cycle slip possible. For phase observations only. *Note*: Bit 0 is the least significant bit.

Bit 1 set: Half-cycle ambiguity/slip possible. Software not capable of handling half cycles should skip this observation. Valid for the current epoch only.

Bit 2 set: BOC-tracking of an MBOC-modulated signal (may suffer from increased noise).

6.7.2 Signal Strength Indicator (SSI)

Signal strength indicators are part of the code and phase observations to offer a compact quality indicator. The generation of the RINEX signal strength indicators **sn_rnx** in the data records (1 = very weak, ..., 9 = very strong) are standardized in case the raw signal strength **sn_raw** is given in **dbHz**:

$$\mathbf{sn_rnx} = \mathbf{MIN(MAX(INT(sn_raw/6), 1), 9)}$$

Table 25 : Standardized SNR Indicators

Carrier to Noise ratio (dbHz)	Carrier to Noise ratio (Observations)
N/A	0 or blank (not known, don't care)
< 12	1 (minimum signal strength)
12-17	2
18-23	3
24-29	4
30-35	5
36-41	6
42-47	7
48-53	8
≥ 54	9 (maximum signal strength)

Additionally, observation codes per signal are specified to store detailed signal strength observations 'Sna' (see Table 10 - Table 16). The **SIGNAL STRENGTH UNIT** header record can be used to indicate the units of these observations.

6.8 Floating point numbers in Navigation data records

The exponent indicator; **E**, **e**, are recommended between the fraction and exponent of all floating-point numbers for the navigation messages. The indicators; **D**, and **d** are allowed but strongly deprecated. Zero-padded two-digit exponents are required.

Examples, from different station navigation files:

```

1.266124167725E-09 2.000000000000E+00 2.069000000000E+03 1.000000000000E+00
7.304595403547E-01-1.565625000000E+01-1.559470529133E+00-9.082521180606E-10

-4.411928222656e+03-3.539047241211e+00 9.313225746155e-10 0.000000000000e+00
2.101021875000e+04 1.440399169922e+00-1.862645149231e-09 0.000000000000e+00

```

The same exponent indicator will be used throughout a navigation file (station or merged).

6.9 Units in Navigation data records

In the **EPH** Navigation Data Records angles and their derivatives transmitted in units of semi-circles and semi-circles/sec have to be converted to radians and radians/sec by the RINEX generator.

In the **ION** navigation Data Records semi-circles are not converted. ICD specific units are retained, no conversion takes place as indicated in Table A32, Table A33, and Table A34.

6.10 Navigation data stored bitwise

Some navigation parameters contain the data stored bitwise. The interpretation is as follows:

- Convert the floating-point number read from the RINEX file into the nearest integer.
- Extract the values of the requested bits from the integer.

Examples:

```

1.790000000000E+02 → 179 →10110011 ; Bits 7,5,4,1,0 are set, all others are zero
6.300000000000E+02 → 63 →111111 ; all six bits are set
5.130000000000E+02 → 513 →1000000001 ; Bits 9,0 are set , all others are zero
4.800000000000E+01 → 48 →110000 ; Bits 5,4 are set , all others are zero

```

6.11 Navigation message transmission time

The transmission time (t_{tm}) in the navigation message definition tables in Section 8.3 denotes the approximate time at which the navigation data were received. It shall allow to discriminate between repetitive transmissions of the same information and is expected to refer to an instant between the beginning of the first navigation frame or message and the end of the last navigation frame or message contributing data to a given RINEX ephemeris record.

The t_{tm} is referred to the constellation specific system time (i.e. GPS time for GPS, BDS time for BDS, etc.) and given in seconds of week. Adjust by $\pm 604800s$ to align t_{tm} to the same week as of the epoch in the **SV / EPOCH / SV CLK** line.

Legacy navigation records without transmit time are permitted for compatibility with past RINEX standards, but strongly deprecated.

Provision of the transmit time is mandatory for all new navigation records introduced in RINEX 4.0.

6.12 Merged Navigation files

A merged navigation file is created by a provider that consolidates the navigation message data from several individual stations over a time period specified in the filename, or from the same individual station to create a station file covering a longer time period.

The aim of the merged navigation file is to contain a complete set of non-redundant navigation records over a specified time frame. This simplifies for the user the task of finding all the original messages over many individual files, plus some quality control can be applied to the messages and the records sorted.

Merged navigation files sorting should aim to include global messages (**STO**, **ION**, **EOP**) at the start of the file and then the **EPH** messages either sorted by constellation prn or by the **EPOCH** record dates.

Merged navigation files should indicate it in their header via the **MERGED FILE** header line, and if known include the number of files merged and the number of stations that participated in the merge. See Table A7 for exact details and an example in Table A8.

8 APPENDIX: RINEX FORMAT DEFINITIONS AND EXAMPLES

8.1 RINEX Long Filenames

The file naming and compression recommendations are strictly speaking not part of the RINEX format definition as described in section 5.1.

Modern operating systems support 255-character file names and thus RINEX has evolved to a file naming convention that is more descriptive, flexible and extensible.

Figure 2 lists the filename elements from the RINEX 3.02 onwards;

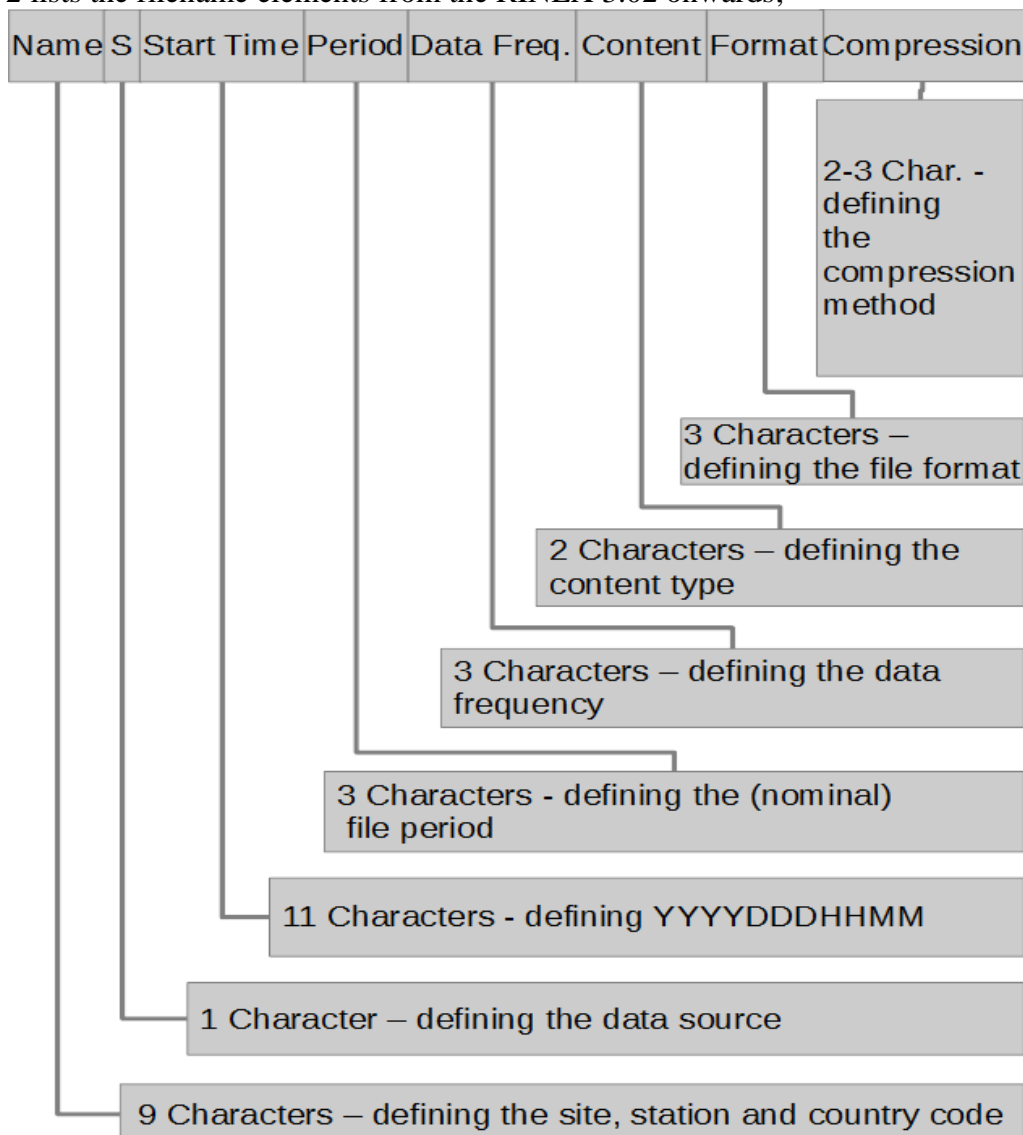

Figure 2: RINEX Long filename parameters.

All elements of the main body of the file name must contain capital ASCII letters or numbers and all elements are fixed length and are separated by an underscore “_”. The file type and compression fields (extension) use a period “.” as a separator and must be ASCII characters and lower case. Fields must be padded with zeros to fill the field width. The file compression field is optional.

In order to further reduce the size of observation files, Dr. Yuki Hatanaka developed a compression scheme that takes advantage of the structure of the RINEX observation data by forming higher-order differences in time between observations of the same type and satellite. This compressed file is also an ASCII file that is subsequently compressed again using standard compression programs.

More information on the Hatanaka compression scheme can be found in:

<https://terras.gsi.go.jp/ja/crx2rnx.html>

- IGSMails 1525,1686,1726,1763,1785,4967,4969,4975

The file naming and compression recommendations are strictly speaking not part of the RINEX format definition. However, they significantly facilitate the exchange of RINEX data in large user communities like IGS, EUREF, APREF, SIRGAS, etc.

Table A1 : RINEX Filename Description

TABLE A1 RINEX FILENAME DESCRIPTION				
Field	Field Description	Example	Required	Comment/Example
<SITE/ STATION- MONUMENT/ RECEIVER/ COUNTRY or REGION>	XXXXMRCCC Where: XXXX - 4 character site designation M – monument or marker number (0-9) R – receiver number (0-9) CCC – ISO Country or Region code (Total 9 characters)	ALGO00CAN	Yes	File name supports a maximum of 10 monuments at the same station and a maximum of 10 receivers per monument. Country or Region code to follow: ISO 3166-1 alpha-3
<DATA SOURCE>	Data Source R – From Receiver data using vendor or other software S – From data Stream (RTCM or other) U – Unknown (1 character)	R	Yes	This field is used to indicate how the data was collected either from the receiver at the station or from a data stream
<START TIME>	YYYYDDDDHHMM YYYY – Gregorian year 4 digits, DDD – day of Year, HHMM – hours and minutes of day (11 characters)	2012150 1200	Yes	For GPS files use: GPS Year, day of year, hour of day, minute of day (see text below for details) Start time should be the nominal start time of the first observation. GLONASS, Galileo, BeiDou, etc use respective system time.
<FILE PERIOD>	DDU DD – file period U – units of file period. File period is used to specify intended collection period of the file.	15M	Yes	File Period 15M–15 Minutes 01H–1 Hour 01D–1 Day 01Y–1 Year 00U-Unspecified

**TABLE A1
RINEX FILENAME DESCRIPTION**

Field	Field Description	Example	Required	Comment/Example
	(3 characters)			
<DATA FREQ>	DDU DD – data frequency U – units of data rate (3 characters)	05Z	Mandatory for RINEX Obs. Data. NOT required for Navigation Files.	XXC – 100 Hertz XXZ – Hertz, XXS – Seconds, XXM – Minutes, XXH – Hours, XXD – Days XXU – Unspecified
<DATA TYPE >	DD DD – Data type (2 characters)	MO	Yes	Two characters represent the data type: MN - Mixed Obs. (All GNSS Constellations tracked) GO - GPS Obs. RO - GLONASS Obs. EO - Galileo Obs. JO - QZSS Obs. CO - BDS Obs. IO - NavIC/IRNSS Obs. SO - SBAS Obs. MN - Mixed Nav. (All GNSS Constellations tracked) GN - GPS Nav. RN - GLONASS Nav. EN - Galileo Nav. JN - QZSS Nav. CN - Beidou Nav. IN - NavIC/IRNSS Nav. SN - SBAS Nav. MM-Meteorological Observation
<FORMAT>	FFF FFF – File format (3 characters)	rnx	Yes	Three characters indicating the data format: rnx – RINEX file crx - Hatanaka Compressed RINEX file
<COMPRESSION>	(2-3 Characters)	gz, bz2, zip	No	Suggested to use gzip, but other options are of course bzip2 and zip , for example.
Sub Total	34 or 35			Fields
Separators	(7 characters –Obs. File) (6 characters –Nav. File)			_ underscore between all fields and “.” Between data type and file format and the compression method
Total	41-42(Obs. File) 37-38 (Nav. File)			Mandatory IGS RINEX obs. Characters

Filename Details and Examples:

<**STATION/PROJECT NAME**>: IGS users should follow XXXXMRCCL (9 char) site and station naming convention described above.

GNSS industry users could use the 9 characters to indicate the project name and/or number.

<**DATA SOURCE**>: With real-time data streaming RINEX files for the same station can be created at many locations. If the RINEX file is derived from data collected at the receiver (official file) then the source is specified as R. On the other hand if the RINEX file is derived from a real-time data stream then the data source is marked as S to indicate Streamed data source. If the data source is unknown the source is marked as U.

<**START TIME**>: The start time is the file start time which should coincide with the first observation in the file. GPS file start time is specified in GPS Time. Mixed observation file start times are defined in the same system time as the file observation system time specified in the header. Files containing only: GLONASS, Galileo, QZSS, BDS or SBAS observations are all based on their respective system time.

<**FILE PERIOD**>: Is used to specify the data collection period of the file.

GNSS observation file name - file period examples:

ALGO00CAN_R_20121601000_15M_01S_GO.rnx.gz //15 min, GPS Obs. 1 sec.
 ALGO00CAN_R_20121601000_01H_05Z_MO.rnx.gz //1 hour, Obs Mixed and 5Hz
 ALGO00CAN_R_20121600000_01D_30S_GO.rnx.gz //1 day, Obs GPS and 30 sec
 ALGO00CAN_R_20121600000_01D_30S_MO.rnx.gz //1 day, Obs. Mixed, 30 sec

GNSS mixed navigation file name - file period examples:

ALGO00CAN_R_20121600000_15M_MN.rnx.gz // 15-minute mixed nav file
 ALGO00CAN_R_20121600000_01H_MN.rnx.gz // 1 hour mixed nav file
 ALGO00CAN_R_20121600000_01D_MN.rnx.gz // 1 day mixed nav file

<**DATA FREQ**>: Used to distinguish between observation files that cover the same period but contain data at a different sampling rate. GNSS data file - observation frequency examples:

ALGO00CAN_R_20121601000_01D_01C_GO.rnx.gz //100 Hz data rate
 ALGO00CAN_R_20121601000_01D_05Z_RO.rnx.gz //5 Hz data rate
 ALGO00CAN_R_20121601000_01D_01S_EO.rnx.gz //1 second data rate
 ALGO00CAN_R_20121601000_01D_05M_JO.rnx.gz //5 minute data rate
 ALGO00CAN_R_20121601000_01D_01H_CO.rnx.gz //1 hour data rate
 ALGO00CAN_R_20121601000_01D_01D_SO.rnx.gz //1 day data rate
 ALGO00CAN_R_20121601000_01D_00U_MO.rnx.gz //Unspecified

Note: Data frequency field not required for RINEX Navigation files.

<DATA TYPE/ FORMAT>: The data type describes the content of the file. The first character indicates constellation and the second indicates whether the files contain observations or navigation data. The next three-character extension indicates the data file format. GNSS observation filename - format/data type examples:

```
ALGO00CAN_R_20121601000_15M_01S_GO.rnx.gz //RINEX obs. GPS
ALGO00CAN_R_20121601000_15M_01S_RO.rnx.gz //RINEX obs. GLONASS
ALGO00CAN_R_20121601000_15M_01S_EO.rnx.gz //RINEX obs. Galileo
ALGO00CAN_R_20121601000_15M_01S_JO.rnx.gz //RINEX obs. QZSS
ALGO00CAN_R_20121601000_15M_01S_CO.rnx.gz //RINEX obs. BDS
ALGO00CAN_R_20121601000_15M_01S_SO.rnx.gz //RINEX obs. SBAS
ALGO00CAN_R_20121601000_15M_01S_MO.rnx.gz //RINEX obs. mixed
```

GNSS navigation filename examples:

```
ALGO00CAN_R_20121600000_01H_MN.rnx.gz //RINEX nav. Mixed
ALGO00CAN_R_20121600000_01H_GN.rnx.gz //RINEX nav. GPS
ALGO00CAN_R_20121600000_01H_RN.rnx.gz //RINEX nav. GLONASS
ALGO00CAN_R_20121600000_01H_EN.rnx.gz //RINEX nav. Galileo
ALGO00CAN_R_20121600000_01H_JN.rnx.gz //RINEX nav. QZSS
ALGO00CAN_R_20121600000_01H_CN.rnx.gz //RINEX nav. BDS
ALGO00CAN_R_20121600000_01H_SN.rnx.gz //RINEX nav. SBAS
```

Meteorological filename example:

```
ALGO00CAN_R_20121600000_01D_30M_MM.rnx.gz //RINEX Met.
```

<COMPRESSION>:

Suggested RINEX file compression methods include: gzip - “.gz”, bzip2 - “.bz2” and “.zip”.

Note: The main body of the file name should contain only ASCII capital letters and numbers. The file extension and compression i.e.; “.rnx.gz” should be lowercase.

8.2 GNSS Observation Data Files

Table A2 : GNSS Observation Data File – Header Section Description

TABLE A2		
GNSS OBSERVATION DATA FILE - HEADER SECTION DESCRIPTION		
HEADER LABEL (Columns 61-80)	DESCRIPTION	FORMAT
RINEX VERSION / TYPE	<ul style="list-style-type: none"> – Format version: 4.00 – File type: O for Observation Data – Satellite System: <ul style="list-style-type: none"> G: GPS R: GLONASS E: Galileo J: QZSS C: BDS I: NavIC/IRNSS S: SBAS payload M: Mixed 	F9.2, 11X A1,19X A1,19X
PGM / RUN BY / DATE	<ul style="list-style-type: none"> – Name of program creating current file – Name of agency creating current file – Date and time of file creation (section 5.2.2) Format: yyyyymmdd hhmms zone zone: 3-4 char. code for time zone. 'UTC' recommended! 'LCL' if local time with unknown time code <i>Note</i> ; This header line must be the second line in the header. Additional lines of this type can appear together after the second line, if needed to preserve the history of previous actions on the file.	A20 A20 A20
*COMMENT	<ul style="list-style-type: none"> – Comment header line(s) 	A60
MARKER NAME	<ul style="list-style-type: none"> – Name of antenna marker <i>Note</i> ; This is a free text field to identify the station with a name as decided by the station operator. To facilitate the identification of RINEX data in large user communities like IGS, EUREF, APREF, SIRGAS, etc the 9-character station ID is expected; XXXXMRCCC (see Table A1)	A60

TABLE A2 GNSS OBSERVATION DATA FILE - HEADER SECTION DESCRIPTION		
HEADER LABEL (Columns 61-80)	DESCRIPTION	FORMAT
*MARKER NUMBER	<p>– Number of antenna marker</p> <p><i>Note</i>; This is an optional free text field to identify the station with some numbering system as decided by the station operator. To facilitate the identification of RINEX data in large user communities like IGS, EUREF, APREF, SIRGAS, etc the IERS DOMES number assigned to the station marker is expected; https://itrf.ign.fr/domes_request.php</p>	A20
MARKER TYPE	<p>- Type of the marker (also see 5.2.3):</p> <p>GEODETIC : Earth-fixed, high- precision monument</p> <p>NON_GEODETIC : Earth-fixed, low- precision monument</p> <p>NON_PHYSICAL : Generated from network processing</p> <p>SPACEBORNE : Orbiting space vehicle</p> <p>GROUND_CRAFT : Mobile terrestrial vehicle</p> <p>WATER_CRAFT : Mobile water craft</p> <p>AIRBORNE: Aircraft, balloon, etc.</p> <p>FIXED_BUOY : "Fixed" on water surface</p> <p>FLOATING_BUOY: Floating on water surface</p> <p>FLOATING_ICE : Floating ice sheet, etc.</p> <p>GLACIER : "Fixed" on a glacier</p> <p>BALLISTIC : Rockets, shells, etc.</p> <p>ANIMAL : Animal carrying a receiver</p> <p>HUMAN : Human being</p> <p>Record required except for GEODETIC and NON_GEODETIC marker types. Users may define other project-dependent keywords.</p>	A20,40X
OBSERVER / AGENCY	– Name of Observer / Agency	A20,A40
REC # / TYPE / VERS	– Receiver number, type, and version (Version: e.g. Internal Software Version)	3A20
ANT # / TYPE	– Antenna number and type	2A20
APPROX POSITION XYZ	– Geocentric approximate marker position (Units: Meters, Frame: ITRF recommended) Optional for moving platforms	3F14.4

TABLE A2		
GNSS OBSERVATION DATA FILE - HEADER SECTION DESCRIPTION		
HEADER LABEL (Columns 61-80)	DESCRIPTION	FORMAT
ANTENNA: DELTA H/E/N	<ul style="list-style-type: none"> – Antenna height: Height of the antenna reference point (ARP) above the marker – Horizontal eccentricity of ARP relative to the marker (east/north) <p>All units in meters (see section 5.2.4)</p>	F14.4 2F14.4
*ANTENNA: DELTA X/Y/Z	– Position of antenna reference point for antenna on vehicle (m): XYZ vector in body-fixed coordinate system (see section 5.2.7)	3F14.4
*ANTENNA: PHASECENTER	<p>Average phase center position with respect to antenna reference point (m) (see section 5.2.5)</p> <ul style="list-style-type: none"> – Satellite system (G/R/E/J/C/I/S) – Observation code – North/East/Up (fixed station) or X/Y/Z in body-fixed system (vehicle) 	A1 1X,A3 F9.4 2F14.4
*ANTENNA: B.SIGHT XYZ	<ul style="list-style-type: none"> – Direction of the “vertical” antenna axis towards the GNSS satellites. <p>Antenna on vehicle: Unit vector in body-fixed coordinate system. Tilted antenna on fixed station: Unit vector in N/E/Up left-handed system.</p>	3F14.4
*ANTENNA: ZERODIR AZI	– Azimuth of the zero-direction of a fixed antenna (degrees, from north)	F14.4

```

The receiver clock offset correction in the epoch record has been placed such that it could be preceded by an identifier to make it system-dependent in a later format revision, if necessary. The clock correction is optional and is given in units of seconds.

TABLE A13 GALILEO INAV/FNAV NAVIGATION MESSAGE RECORD DESCRIPTION		
NAV. RECORD	DESCRIPTION	FORMAT
BROADCAST ORBIT - 5	<ul style="list-style-type: none"> - IDOT (radians/sec) - Data sources (binary number) <ul style="list-style-type: none"> Bit 0 set: I/NAV E1-B Bit 1 set: F/NAV E5a-I Bit 2 set: I/NAV E5b-I Bits 0 and 2: Both can be set if the INAV navigation messages were merged, however, bits cannot all be set, as the INAV and FNAV messages contain different information. Bit 3 reserved for Galileo internal use Bit 4 reserved for Galileo internal use Bit 8 set: af0-af2, Toc, SISA are for E5a,E1 Bit 9 set: af0-af2, Toc, SISA are for E5b,E1 Bits 8-9 : exclusive (only one bit can be set) - GAL Week # (to go with TOE) 	4X,3D19.12 4*) 5*)
BROADCAST ORBIT - 6	<ul style="list-style-type: none"> - SISA Signal in space accuracy (meters) No Accuracy Prediction Available (NAPA) / unknown: -1.0 - SV health (See Galileo ICD Section 5.1.9.3) <ul style="list-style-type: none"> Bit 0: E1B DVS Bits 1-2: E1B HS Bit 3: E5a DVS Bits 4-5: E5a HS Bit 6: E5b DVS Bits 7-8: E5b HS - BGD E5a/E1 (seconds) - BGD E5b/E1 (seconds) 	4X,4D19.12 4*)
BROADCAST ORBIT - 7	<ul style="list-style-type: none"> - t_tm : Transmission time of message (sec of GAL week, see section 6.11) 2*) 	4X,1D19.12

*) see section 6.8.

2*) Adjust the *Transmission time of message* by + or -604800 to refer to the reported week in **BROADCAST ORBIT 5**, if necessary. Set value to **.9999E+09** if not known. Legacy navigation records without transmit time are permitted for compatibility, but strongly deprecated.

4*) For Navigation data fields stored bitwise see section 6.10.

5*) The GAL week number is a continuous number, aligned to (and hence identical to) the continuous GPS week number used in the RINEX navigation message files. The broadcast 12-bit Galileo System Time (GST) week has a roll-over after 4095. It started at zero at the first GPS roll-over (continuous GPS week 1024). Hence GAL week = GST week + 1024 + n*4096 (n: number of GST roll-overs).

6*) For Navigation data fields stored bitwise see section 6.10. If bit 0 or bit 2 of Data sources (**BROADCAST ORBIT - 5**) is set then the SV health parameter; 'E1B DVS' & 'E1B HS', 'E5b DVS' & 'E5b HS' and both 'BGDs' are valid. If bit 1 of Data sources is set then 'E5a DVS' & 'E5a HS' and BGD E5a/E1 are valid. Non-valid parameters are set to 0 and to be ignored.

8.6 Reference Phase Alignment by Constellation and Frequency Band

Phase alignment in RINEX was introduced from RINEX 3.01 as a way to align phases within a signal in a specific constellation with no ambition to align across constellations.

This alignment of phases allows interoperability between different signals in the same frequency while signals are being deployed over a constellation, and when receivers do not track the same set of signals for all satellites of a constellation.

Table A39 : Reference Phase Alignment by Frequency Band

TABLE A39					
Reference Phase Alignment by Frequency Band					
System	Frequency Band	Frequency [MHz]	Signal	RINEX Observation Code	Phase Alignment
GPS	L1	1575.42	C/A	L1C	None (Reference Signal)
			L1C-D	L1S	Must be aligned to L1C
			L1C-P	L1L	Must be aligned to L1C
			L1C-(D+P)	L1X	Must be aligned to L1C
			P	L1P	Must be aligned to L1C
			Z-tracking	L1W	Must be aligned to L1C
			Codeless	L1N	Must be aligned to L1C
	L2 (See Note 1)	1227.60	C/A	L2C	For Block II/IIA/IIR; None, For Block IIR-M/IIF/III; Must be aligned to L2P (See Note 2)
			Semi-codeless	L2D	None
			L2C(M)	L2S	Must be aligned to L2P

TABLE A39					
Reference Phase Alignment by Frequency Band					
System	Frequency Band	Frequency [MHz]	Signal	RINEX Observation Code	Phase Alignment
NavIC/ IRNSS	L5	1176.45	A SPS	L5A	None (Reference Signal)
			B RS(D)	L5B	Restricted (See Note 3)
			C RS(P)	L5C	None
			B+C	L5X	Must be aligned to L5A
	S	2492.028	A SPS	L9A	None (Reference Signal)
			B RS(D)	L9B	Restricted (See Note 3)
			C RS(P)	L9C	None
			B+C	L9X	Must be aligned to L9A

Notes:

1. The GPS L2 phase shift values ignore FlexPower when the phases of the L2W and L2C can be changed on the satellite. The phases L2C shall be aligned to L2P when FlexPower is off, the phase shift shall remain applied even if FlexPower is enabled.
2. The phase of the L2 C/A signal is dependent on the GPS satellite generation.
3. There is no public information available concerning the restricted service signals.
4. Note: Both C1x and C2x (RINEX 3.01 definition) have been used to identify the B1 frequency signals in RINEX 3.02 files. If C2x coding is read in a RINEX 3.02 file treat it as equivalent to C1x.
5. L6D, L6P, L6E are identical to L61/L62(code1), L61(code2), L62(code2) in IS-QZSS-L6 respectively
6. Either L1C or L1E is broadcast from each QZSS Block IIA or later.

9 RINEX 3.05 TO 4.00 FULL REVISION HISTORY

01 Dec 2020	RINEX 3.05 Released
5 Mar 2021	<ul style="list-style-type: none"> - Expanded Section 2 to include the version 4 introduction - Section 5.2.16 corrected ‘Lamba’ typo in bullet point list to ‘Lambda’ - Table A13 corrected ‘GALyear’ and moved ‘year’ to the next line - Section 6.8 added the recommendation to use E, e as the exponent indicators in the navigation messages, D and d are still allowed but deprecated. - In Table A1 changed the station name definition ‘XXXX’ to the more generic; ‘4-character site designation’ - In Table A2 added language to specify that MARKER NAME is proposed to be the station ID; XXXXMRCCC for permanent stations. - In Table A2 added language to specify that MARKER NUMBER is proposed to be the DOMES number for permanent stations, if available. - Updated the version number to 4.00 throughout the document - Table A7 removed the optionality of the LEAP SECONDS line in the header of the Navigation files, the line now becomes compulsory.
10 Mar 2021	<ul style="list-style-type: none"> - Table A7 changes; <ul style="list-style-type: none"> — Restricted Navigation files to ‘M: Mixed’ mode only, no more individual GNSS constellation navigation files, all navigation files shall aim to provide all navigation messages for the satellites in view and tracked.(reversed) - Removed the IONOSPHERIC CORR line from the Navigation file header as they are replaced by a dedicated navigation file data record. - Removed the TIME SYSTEM CORR line from the Navigation file header as they are replaced by a dedicated navigation file data record.
12 Mar 2021	<ul style="list-style-type: none"> - GPS LNAV Navigation Message Table A6 renamed Table A9 and added navigation message record new first line. - Added GPS CNAV Navigation Message Table A10 to define the extended GPS CNAV navigation record. - Added GPS CNV2 Navigation Message Table A11 to define the extended GPS CNAV-2 navigation record. - Added relevant examples to Table A12 for the GPS Navigation messages
15 Mar 2021	<ul style="list-style-type: none"> - Renamed and added navigation message record new first line. - Added new GAL navigation message examples to Table A14. - Renamed GLONASS FDMA Navigation Message Table A10 to Table A15 and added navigation message record new first line. - Added new GLO navigation message examples to Table A16.
18 Mar 2021	<ul style="list-style-type: none"> - Renamed Beidou D1/D2 Navigation Message Table A14 to (Table A21) and added navigation message record new first line. - Added Beidou CNV1 Navigation Message (Table A22) to define the BDS-3 B1C signal navigation message.

	<ul style="list-style-type: none"> - Added Beidou CNV2 Navigation Message (Table A23) to define the BDS-3 B2a signal navigation message. - Added Beidou CNV3 Navigation Message (Table A24) to define the BDS-3 B2b signal navigation message. - to define the BDS-3 B2b signal navigation message. - Renamed QZSS LNAV Navigation Message from the previous Table A12 to Table A17 and added navigation message record new first line. - Added QZSS CNAV Navigation Message Table A18 to define the QZSS CNAV signal navigation message. - Added QZSS CNV2 Navigation Message Table A19 to define the QZSS CNAV-2 signal navigation message. - Added new QZSS navigation message examples to Table A20.
19 Mar 2021	<ul style="list-style-type: none"> - Added navigation message record new first line to SBAS Navigation Message Table A26. - Added new SBAS navigation message examples for Table A27. - Added navigation message record new first line to NavIC/IRNSS LNAV Navigation Message (Table A28). - Added new NavIC/IRNSS navigation message examples for Table A29. - Added new Table A30 for the navigation message System Time Offset records.
22 Mar 2021	<ul style="list-style-type: none"> - Added section 5.4.1 to describe the new Navigation Data Record Header Line. - Updated the descriptions of the navigation messages for each of the constellations in sections; 5.4.2, 5.4.4, 5.4.3, 5.4.7, 5.4.6, 5.4.5, 5.4.8 - Added section 5.4.9 to describe the new STO Time offset correction messages in the navigation message file. - Added section 5.4.10 to describe the new EOP Earth orientation parameter messages in the navigation message file. - Added section 5.4.11 to describe the new ION Earth orientation parameter messages in the navigation message file.
23 Mar 2021	<ul style="list-style-type: none"> - Added Table A30, Table A31, Table A32, Table A33, and Table A34 to the Appendix to define the new STO, EOP, and ION message record descriptions. - Added Table A35 with STO, EOP, and ION message examples. - Added Table A12 as an example of the new Navigation message file header.
15 Apr 2021	<ul style="list-style-type: none"> - Moved Table titles to above each Table throughout the entire document - Changed the Appendices in Section 8 to regular subsections and consolidated the subsections - Changed the Appendix tables to regular Table numbering and referencing in the Table of Tables.
27 Apr 2021	<ul style="list-style-type: none"> - Added REC # / TYPE / VERS line to the Navigation message file header in Table A7. The receiver information is an optional line in the format definition, it is expected to be included in station navigation files

	and excluded in merged navigation files.
30 Apr 2021	<ul style="list-style-type: none"> - Added new section 6.11 on merged navigation files. Such files are very popular and some comments are included so that generators of these files and users know what to expect — In section 8.1 removed the examples of filenames for individual GNSS constellations, all navigation files henceforth will be Mixed navigation files as indicated in Table A7.(reversed) - Revised Table A2 and Table A7 field definitions of the LEAP SECOND line header line to only align to leap seconds since start of GPS time (6 Jan 1980).
21 May 2021	<ul style="list-style-type: none"> - Revised and clarified language throughout the document - Added Doppler and SNR measurements as relevant RINEX observables in section 2. - Updated Table 2 for clarity. - Updated Galileo Open Service signal-in-space reference in section 7.
24 May 2021	<ul style="list-style-type: none"> - Updated section 6.11 and Table A7 to clarify Navigation Merged file - Removed incorrect “END OF FILE” COMMENT line from Observation file Examples (Table A5, Table A6). - Adjusted Navigation Message transmission time clarification in the section 8 navigation message definition tables to allow default value for ‘not known’ only for legacy navigation messages as a strongly deprecated compatibility option. All newly defined navigation data records need to report the transmission time and DO NOT have the option of using the ‘not known’ default value. - Clarified the SatType, Health bits and Integrity flags for the BDS CNAV messages (Table A22, Table A23, Table A24). - Moved clarification notes about the angles and semicircles being converted to radians from each navigation message definition table into section 6.9. - Clarified in Table A31 that the EOP message value $\Delta UT1$ can be different depending on the constellation that reports it. - Clarified the ION message Region code for the Klobuchar message (Table A32). - Clarified the ION message Disturbance flags for the NEQUICK-G message (Table A33).
26 May 2021	<ul style="list-style-type: none"> - Added units to the Alpha and Beta ION message parameters for the Klobuchar message in Table A32. - Added units to the ‘a’ parameters for the NEQUICK-G ION messages in Table A33. - Added units to the Alpha parameters for the BDGIM ION messages in Table A34. - Removed the text in section 2 about all spin-off formats (IONEX, ANTEX, etc) which are not related to the RINEX data format. - Removed text in section 4.2 about how raw pseudoranges should be handled since in RINEX it is enough to state that all pseudoranges must refer to one receiver clock, how this is accomplished is up to the receiver or the conversion software.

	<ul style="list-style-type: none"> - Added Doppler correction to Table 5: Observation Corrections for Receiver Clock Offset. - Updated Figure 1 with the official NavIC name. - Updated NavIC ICD reference in section 7. - Standardized the use throughout the document of BNK to indicate “Blank if Not Known/Not Defined”.
8 Jun 2021	<ul style="list-style-type: none"> - Corrected unknown Navigation message transmission time of message to use value 0.9999E+09 if not known (below Table A9, Table A13, Table A17, Table A21, and Table A28). Legacy navigation records without transmit time are permitted for compatibility, but strongly deprecated.
10 Jun 2021	<ul style="list-style-type: none"> - Added a clarification paragraph to the start of section 8.6 to better explain that phase alignments are limited to the signals per frequency per constellation and that there is no ambition to try to align across constellations. - Updated Table A39 to remove specific correction values and instead indicate the reference signal to be aligned to per frequency band. For RINEX creators how they align depends on the internal tracking characteristics of each receiver design. - In Table A2 made the header line “SYS / PHASE SHIFT” optional since the details of what was done to align the signals, as required in Table A39, are not really necessary to a RINEX file user. These header lines are now strongly deprecated.
15 Jun 2021	<ul style="list-style-type: none"> - Simplified the text in section 5.2.12 since it is sufficient to indicate in the format document that all phases for a given frequency band in a constellation be aligned to the designated reference signal as specified in Table A39.
2 Jul 2021	<ul style="list-style-type: none"> - Updated RINEX Data File Examples throughout the document. - Updated out of date ICD references.
9 Jul 2021	<ul style="list-style-type: none"> - Changed Navigation Message Format definitions for ‘Spare’ fields to ‘A19’ Format. Spare fields in the middle of navigation message lines should be set to blanks and skipped over when reading, as stated in section 6.4. - Added definition of QZSS L1 C/B new signal to Table 14 with observation codes C1E, L1E, D1E, S1E and in Table A39 as the new reference signal when L1 C/A is not available. - Added QZSS PRN code assignments to include L1 C/B PRNs in Table 6.
14 Jul 2021	<ul style="list-style-type: none"> - Update of the GPS ICD references (Section 7) to the new issues of the documents; 200M, 705H and 800H of May 2021, plus the internal references throughout the document. - Update of the QZSS ICD references for QZSS-L6-003 and QZSS-PNT-004 to the latest versions.
21 Jul 2021	<ul style="list-style-type: none"> - Added units to the STO polynomial parameters in Table A30.
25 Jul 2021	<ul style="list-style-type: none"> - Added clarification in section 4.1 to indicate consistently for each GNSS System Time to what UTC(k) each GNSS is steered. - Removed the mandatory condition to the GLONASS Code-Phase alignment header record GLONASS COD/PHS/BIS in section 5.2.16 and Table A2. It is essential that all code and phase measures be aligned

	<p>as always in RINEX, but having to indicate the GLONASS alignment values in the file header is no longer required, it is optional, and only if known and non-zero</p> <ul style="list-style-type: none"> - Removed the old Table 9 and Table 10 from section 5.2.16 as examples of the optional GLONASS code-phase alignment header line already exist in Table A4, Table A5, and Table A6.
27 Jul 2021	<ul style="list-style-type: none"> - Renamed section 8.6 and Table A39 to “Reference Phase Alignment”
6 Sept 2021	<ul style="list-style-type: none"> - Clarified in Table A2 that the MARKER NAME and MARKER NUMBER are free fields and that the official station name and DOMES number are expected in geodetic network stations part of large user communities like IGS, EUREF, APREF, SIRGAS, etc. - Removed specific vendor information from the RINEX Example snippets in Section 8 so as to stay neutral. - Added subsection headings in Section 8.3 and 8.4 for easier navigation to the new navigation file messages. - Removed reference to the length of the SI second from section 4.1, this is not relevant for RINEX and can lead to confusion. - For consistency changed “time system” mentions for “system time”.
15 Sep 2021	<ul style="list-style-type: none"> - Added three free text optional header lines to Table A2, Table A7, and Table A36 to support the FAIR data principles addressing the Finding, Accessing, Interoperability and Reusability of public data; <ul style="list-style-type: none"> - DOI – Digital Object Identifier - LICENSE OF USE – Data license - STATION INFORMATION – Link to station metadata - Added the explicit instruction that more than one PGM / RUN BY / DATE line can appear in the Observation file header definition from the second header line onwards (Table A2) , if needed, to be able to better save the history of the actions on the file. - Added clarifications to section 5.1 to clearly indicate that the proposed filenames are a recommendation, and not part of the RINEX format.
27 Sep 2021	<ul style="list-style-type: none"> - Corrected BDS CNAV-3 message in Table A24 - Clarified QZSS constellation and signal to include mention of L1 C/B in Table 20, and Table 21 - Updated the examples for GPS and QZSS navigation messages in Table A12, and Table A20.
8 Oct 2021	<ul style="list-style-type: none"> - Corrected the document to allow back constellation specific navigation files.
11 Oct 2021	<ul style="list-style-type: none"> - Corrected broken internal references and several typos. - Copied leap second header line definition from the Navigation Header Table (Table A7) to the Observation File Header Table (Table A2) for consistency. - Added QZSS “do not use bit pattern” clarification for TGD and ISC values to the CNAV/CNAV-2 navigation messages (Table A18, Table A19).
18 Oct 2021	<ul style="list-style-type: none"> - Clarified language for character fields, variable-length records, GNSS system time alignments to UTC, etc.
22 Oct 2021	<ul style="list-style-type: none"> - Clarified and added examples to DOI and LICENSE header lines, - Added newest version of QZSS L6 ICD to section 7

25 Oct 2021	<ul style="list-style-type: none"> - Added units to A DOT (m/s), t_op (seconds), ISC_ (seconds), TGD_ (seconds) navigation parameters in all relevant tables. - For consistency with the other navigation message parameter names added the middle underscore to the parameter names Crs, Crc, Cuc, Cus, Cic, Cis in the legacy navigation messages in Table A13, Table A17, Table A21, and Table A28. - Corrected the QZS L1Sb alignment in Table A39 to “N/A” as this signal is transmitted from an independent payload on the QZSS satellite (different antenna), and hence cannot be aligned. - Deleted ‘Note 5’ of Table A39 as it is no longer an applicable comment since the simplification of the table.
28 Oct 2021	<ul style="list-style-type: none"> - Added further clarification to the MARKER NAME and MARKER NUMBER header lines in Table A2 to insist on the best practice expected for large user communities like IGS, EUREF, APREF, SIRGAS, but to clearly indicate these are free text fields for the station operators to identify their RINEX data as they wish. - Added new section 6.11 to explain the expectations of the navigation messages transmission time. - Clarified the navigation message transmission time (t_tm) to make it uniform across all the different constellation message tables in section 8.3, added link from the navigation message definition tables to section 6.11.
01 Nov 2021	<ul style="list-style-type: none"> - Corrected the gsi.go.jp links to “https” - Clarified the QZSS navigation message header satellite identification “Sat system (J), sat number (see Table 6)” in Table A17, Table A18, Table A19. - Clarified in Table A26 in the two header lines that the SBAS satellite number is “PRN-100”.
04 Nov 2021	<ul style="list-style-type: none"> - Corrected the Transmission time to the ION messages (in section 8.4) to make them all consistent since the ionosphere data has no proper “clock time” and thus the time stamp for the ION messages is the transmit time. - Added clarification text that in the GPS/QZS new CNAV/CNAV2 messages the wn_op parameter is the GPS continuous week number with the ambiguity resolved (Table A10, Table A11, Table A18, Table A19).
01 Dec 2021	RINEX 4.00 Released
